

Management of EQ programs a Mochovce NPP, Unit 3 and 4, in the Slovak Republic

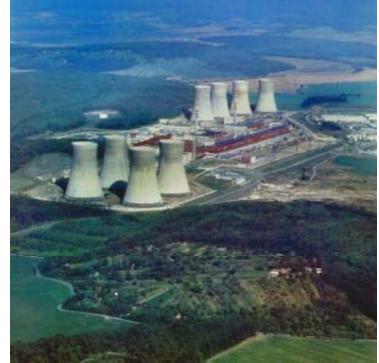

IEEE SC2, Seattle 7th October, 2010

1. Introduction

 Mochovce NPP consisting of four pressurized water reactors of Russian design type VVER 440/213 (unit output 440 MWe).

 Owner of the plant is Slovenské elektrárne, a nationally-owned company with a majority financial interest held by Enel, an Italian utility company.

2. Brief History

- Preparatory work was started on June 1981, and site construction for Mochovce 1 and Mochovce 2 started in November 1982.
- Construction of the remaining two units, Mochovce 3 and Mochovce 4, began in 1985 but work on all four units was halted in 1991 due to a lack of funds. In 1995 the Slovak government approved a plan to finish the first pair with additional Western safety technology. The first two units were commissioned in 1998 and 1999 respectively.
- Installed capacity of units 1 and 2 was up-rated by 7% in 2008.
- Construction of Units 3 and 4 restarted in November 2008 and is planned to be completed in 2012 and 2013.

4. Public Opinion & Electricity Needs

 Commissioning of the plant has sparking protests in Austria - a neighboring country strongly opposed to the

use of nuclear energy in general.

 Completion of 2 units is higly demanded project because energy security of Slovak Republic (after decomisioning 2 units of EBO V1 NPP - 500 MWe permannent outage).

5. Nuclear Safety & EQ

- In 2006, State Regulatory Authority (ÚJD) introduced completely new nuclear legislation.
- New legal nuclear codex recognized and define the term Equipment Qualification
- Anyhow, the term Equipment Qualification has been defined hard widely and freely applied interpretation causing headaches of suppliers managing directors with signed fixed price contracts.
- Through the methodology documents there is established process of equipment qualification explained as fight against common cause failure – principles of Defense in the depth approach, see IAEA SRS No. 3.

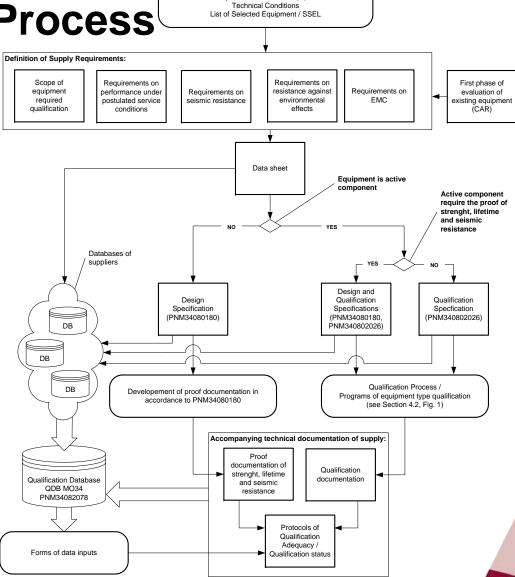

6. Methodology

- There was issued a set of 5 methodologies defining the scope and requirements for safety-related equipment documentation – graded approach.
- IEC 60780 has defined as a basis standards for Equipment Qualification.
- IEEE 323 general qualification standard has been introduced as fully compatible with IEC 60780.
- Specific IEEE and other international recognized standards are recommended for individual types of equipment (cca 30 Equipment Classes)

6. Documentation Process

- Qualification specification defines the requirements on scope of qualification documentation for specific equipment in technological/process chains MO34.
- Individual Qualification Programs
 defines the roadmap how to
 achieved qualification
 requirements specified in
 Qualification Specification for
 equipment that
- Qualification Summary Report summarized and evaluated documentation of EQ programs.
- Qualification Adequacy Protocols collect the essential EQ data and defined qualification status = qualification life + conditions

Basic Design
Quality Plans of Selected Equipment

9. Lessons Learned

- The top managers of several companies misunderstanding the term of Equipment Qualification: after 1 year of preparation documents start to recognize distinction between Quality Assurance documents and EQ documentation.
- Overinflating of qualification requirements. (DESIGN VS ENVIRONMENTAL QUALIFICATION) The originally designed equipment according to industrial accepted standards are required to be qualified according to civil structure standard STN 332000-3 defining the special design features to equipment (see vibration resistance AH2 etc.) – the need to follow IEEE Std 627-2010!!
