Passive Wireless Sensor Workshop at WiSEE 2017

Agenda

- **Motivation for Passive Wireless Sensors,
a Tool in the Toolbox for “Fly-by-Wireless”**
- **PWS Workshops – Purpose and Objectives**
- **PWS Workshop Summaries (reference)**
 - 2017 PWST – October in Montreal, CA Host: IEEE/WiSEE 2017
 - 2016 PWST – September in Aachen Germany Host: IEEE/WiSEE 2016
 - 2015 PWST – December in Orlando, FL Host: IEEE/WiSEE 2015
 - 2015 PWST - May in Arlington, VA Host: DOE/FIIW 2015
 - 2013 PWST – May in Washington, DC Host: ISA Comm Div
 - 2012 PWST - June in La Jolla, CA - Host: ISA Comm Div
 - 2011 PWST - July in Houston, TX Host: ISA Comm Div/BP

Released to General Public ONLY: NO ITAR, NO SBU, NO Proprietary
responsibilities of the material is solely the responsibility of the presenter.
NASA and the organizations hosting the PWST Workshops do not endorse any of the presentations

Space Shuttle Lessons Learned from Wireless Sensor Experiences

- Technology demo can be funded if also meets strong user need.
- Can leverage SBIR/STTR to incrementally increase capability.
- Vehicle integration & ops are biggest cost/schedule drivers.
- Go for Smart, Standalone, Small SWAP & Foot-print (drawings).
- Safety & Communication Reliability concerns can be overcome with engineering.
- Batteries are a big limitation for application and operations.
- Eliminate wire between the DAQ and sensor(Passive Wireless Sensors).

Actual Space-flight Wireless Sensor Flight Applications:

- Shuttle-based Wireless Instrumentation Systems for Payload Bay module temperatures
- ISS Assembly – Z1 and P6 temperatures while unpowered prior to mate
- Integrated ISS Structural Loads & Dynamics Model Validation – modules & truss segments
- Shuttle and ISS Temperature monitors – crew middeck, wing, airlock
- Shuttle Structural Loads/Dyn – Cargo Trunnion, SSME struts, SSME feedlines OMS Pods
- **Shuttle Wing Leading Edge Ascent and MMOD Impact – STS-114 and subsequent flights**
- Shuttle RMS (arm with 50' boom) – strain(loads) at SRMS joints; astronaut-induced loads
- ISS Ultrasonic Background Noise – ultrasonic monitoring/location in module walls
- ISS Bigelow Experiment Module – deployment loads/dynamics and impact detection
- ISS External Wireless Network → External High Definition Camera
- ISS REALL RFID-based Inventory System

Wireless Sensor Experience since the late 1990's Wing Leading Edge Impact Detection System

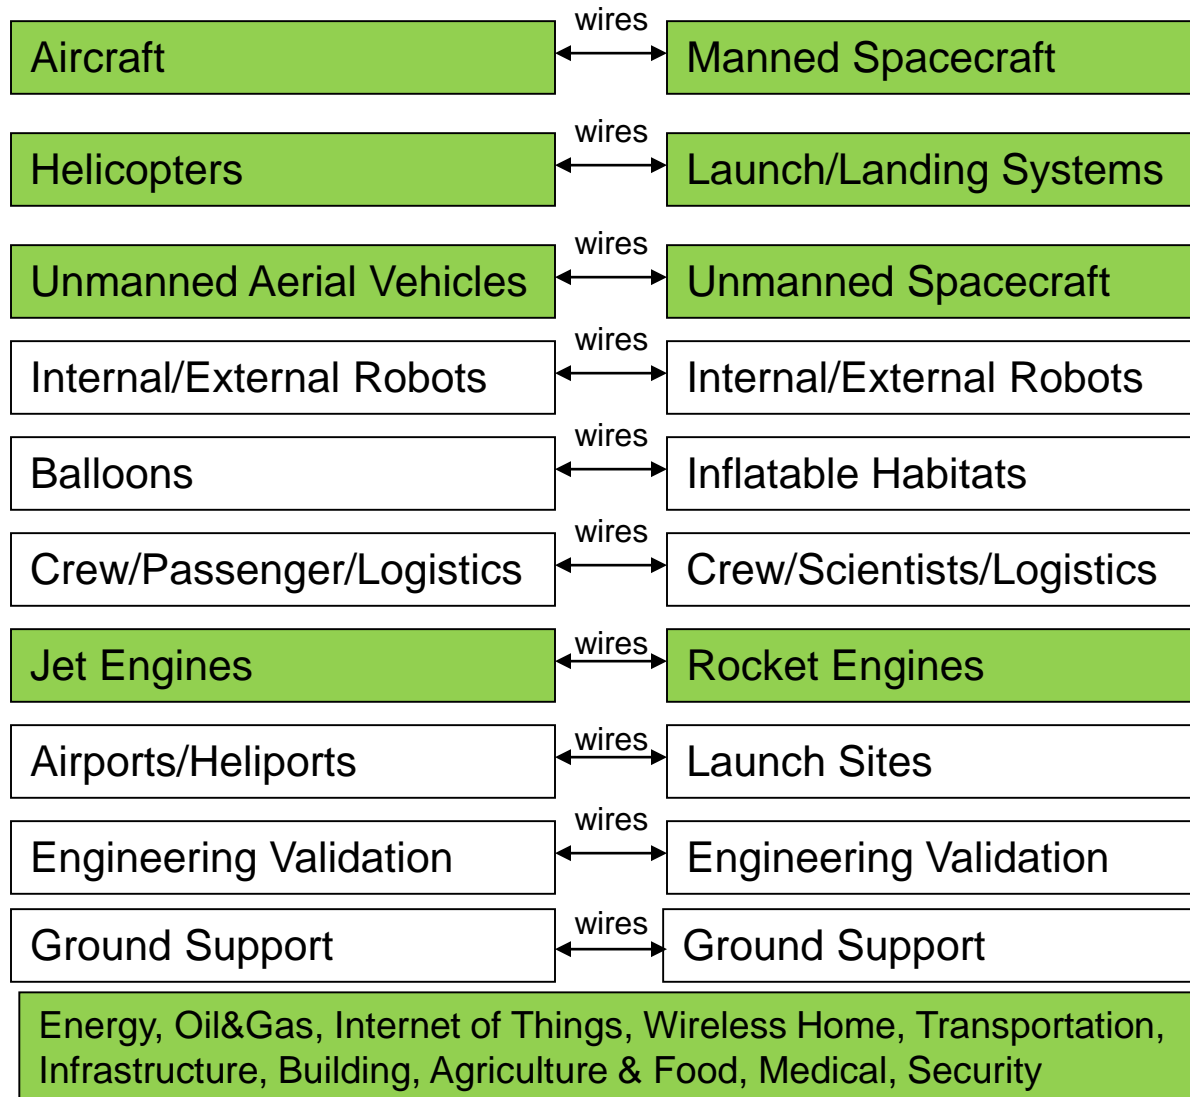

What Do the 2 sides of Aerospace Have in Common?

Wires!!

Aviation

Space

What do these have in common?

1. Data, Power, Grounding Wires and Connectors for: Avionics, Flight Control, Data Distribution, IVHM and Instrumentation.
2. Mobility & accessibility needs that restrict use of wires.
3. Performance issues that depend on weight.
4. Harsh environments.
5. Limited flexibility in the central avionics and data systems.
6. Limited accessibility.
7. Need to finalize the avionics architecture early in the lifecycle.
8. Manufacturing, pre and post delivery testing.
9. Schedule pressure, resource issues, security and reliability.
10. Operations and aging problems.
11. Civilian, military, academic & international institutions.
12. Life-cycle costs due to wired infrastructure.
13. **Need for Wireless Alternatives!!**

Common Motivations

Wireless Alternatives for Systems, Vehicles and Facilities:

- 1. Cost and Schedule of Wired Infrastructure**
- 2. Cost of Change**
- 3. Reliability**
- 4. Size, Weight and Power impacts**

Others:

- Maintainability**
- Safety**
- Security (some applications)**
- System Functionality**
- Changes in System Engineering & Integration, Vehicle Architecture and Technology Development/Awareness**

1. Motivation: Cost of Wired Infrastructure

- Expenses for Cabled Connectivity beginning in Preliminary Design Phase and continuing for the entire system life cycle.
- Reducing the quantity and complexity of the physical interconnects has a payback in many areas.
 1. Failures of wires, connectors and the safety and hazard provisions in avionics and vehicle design to control or mitigate the potential failures.
 2. Direct Costs: Measurement justification, design and implementation, structural provisions, inspection, test, retest after avionics r&r, logistics, vendor availability, etc.
 3. Cost of Data not obtained: Performance, analyses, safety, operations restrictions, environments and model validations, system modifications and upgrades, troubleshooting, end of life certification and extension.
 4. Cost of Vehicle Resources: needed to accommodate the connectivity or lack of measurements that come in the form of weight, volume, power, etc.
 5. Reliability Design Limitations: avionics boxes must build in high reliability to “make up for” low reliability cables, connectors, and sensors. Every sensor can talk to every data acquisition box, and every data acquisition box can talk to every relay box -backup flight control is easier.

1. Motivation: The Cost of Wired Infrastructure (continued)

6. **Physical Restrictions**: Cabled connectivity doesn't work for monitoring: structural barriers limit physical access and vehicle resources, the assembly of un-powered vehicle pieces (like the ISS), during deployments (like a solar arrays, cargo and payloads, or inflatable habitat), crew members, robotic operations, proximity monitoring at launch, landing or mission ops.
7. **Performance**: Weight is not just the weight of the cables, it is insulation, bundles, brackets, connectors, bulkheads, cable trays, structural attachment and reinforcement, and of course the resulting impact on payloads/operations. Upgrading various systems is more difficult with cabled systems. Adding sensors adds observability to the system controls such as an autopilot.
8. **Flexibility of Design**: Cabling connectivity has little design flexibility, you either run a cable or you don't get the connection. Robustness of wireless interconnects can match the need for functionality and level of criticality or hazard control appropriate for each application, including the provisions in structural design and use of materials.
9. **Cost of Change**: This cost grows enormously for as each flight grows closer, as the infrastructure grows more entrenched, as more flights are "lined-up" the cost of delays due to trouble-shooting and re-wiring cabling issues is huge.

2. Motivation: Cost of Change for Instrumentation

The earlier conventional instrumentation is fixed, the greater the cost of change.

- Different phases uncover and/or need to uncover new data and needs for change.
- Avionics and parts today go obsolete quickly - limited supportability, means big sustaining costs.
- The greater number of integration and resources that are involved, the greater the cost of change.
- Without developed/test systems and environments, many costly decisions result.

We need to design in modularity and accessibility so that:

1. We can put off some decisions until:

- sufficient design, tests/analysis can be made.
- optimum technologies can be applied.

The more complete the vehicle
the greater cost of change to the
program and the facility used

2. We can get data for decisions that have to made.

- anomalies
- modifications
- performance improvements
- mission ops changes
- “stuff” that happens

3. Motivation: Reliability

Vehicle Reliability Analyses must include: the End to End system, including man-in-the-loop operations, and the ability to do effective troubleshooting, corrective action and recurrence control.

With Wireless Interconnects, the overall Vehicle Reliability is Increased:

Through Redundancy: All controllers, sensors, actuators, data storage and processing devices can be linked with greater redundancy. A completely separate failure path provides greater safety and reliability against common mode failures.

Through Structural and System Simplicity: Greatly reduced cables/connectors that get broken in maintenance, must be trouble-shot electronics problems, sources of noisy data and require structural penetrations and supports.

Through Less Hardware: Fewer Cables/Connectors to keep up with

Through Modular Standalone Robust Wireless Measurement Systems: These can be better focused on the system needs and replaced/upgraded/reconfigured easily to newer and better technologies. Smart wireless DAQs reduce total data needed to be transferred.

Through Vehicle Life-Cycle Efficiency: Critical and non-critical sensors can be temporarily installed for all kinds of reasons during the entire life cycle.

Through the Optimum Use of Vehicle and Human Resources: Wireless can enable distributed and more flexible instrumentation installations, which reduces demands on system experts to be involved with hardware and software integration planning and issues.

Wireless and Less Wire Options need to be added to System Engineering, Integration and Test

“Fly-by-Wireless” Vision:

To Minimize Cables and Connectors and Increase Functionality across the aerospace industry by providing reliable, lower cost, modular, and higher performance alternatives to wired data connectivity to benefit the entire vehicle/program life-cycle.

Focus Areas:

1. System engineering & integration methods to reduce cables & connectors.
2. Vehicle provisions for modularity and accessibility.
3. A “tool box” of alternatives to wired connectivity.

What it is NOT:

- A vehicle with no wires.
- Wireless-only for all control systems.

**Active Wireless
Passive Wireless
Other Technologies**

“Fly-by-Wireless” Focus Areas

(1) System engineering and integration to reduce cables and connectors,

- Capture the true program effects for cabling from launch & manned vehicles.
- Requirements that enable and integrate alternatives to wires.
- Metrics that best monitor progress or lack of progress toward goals.(# cables, length, # of connectors/pins, # of penetrations, overall weight/connectivity, total data moved/lb).
- Design Approach that doesn't assume a wires-only approach, but optimizes all practical options, providing for the inevitable growth in alternatives to wired connectivity.

(2) Provisions for modularity and accessibility in the vehicle architecture.

- Vehicle Zone Accessibility – Considers standalone sensors along with system assembly, inspections, failure modes/trouble-shooting, system/environment monitoring, remove & repair.
- Vehicle Zone Modularity – Vehicle wired buses provide power, two-way data/commanding, grounding and time in a plug-and-play fashion. Wireless networks are standardized by function and are also plug-and-play.
- Centralized & De-centralized approaches are available for measurement & control.
- Entire life-cycle considered in addition to schedule, performance, weight & volume.

(3) Develop Alternatives to wired connectivity for the system designers and operators.

- Plug-n-Play wireless devices
- Wireless no-power sensors/sensor-tags
- Standalone wireless smart data acquisition
- Standardized I/Fs, networks & operability
- Wireless controls – back-up or low criticality
- Robust high speed wireless avionics comm.
- Inductive coupling w/rechargeable batteries
- Data on power lines, light, structure, liquids
- No connectors for bulkheads, avionics power
- Robust software programmable radios
- Light wt coatings, shielding, connectors
- RFID for ID, position, data, & sensing.
- Various Passive Wireless Sensing Options
- Other power & comm scavenging schemes

What Wireless?

Fewer Connectors

Passive Wireless Sensor Systems:

- Applications – no wire to sensor
- Sensor Cost - no battery, no radio
 - manufacture in quantity
- Operations – no battery replacement
- Performance – weight, footprint
 - extreme environments
- Safety – little or no stored power
- RFID and Location options

Hybrid Sensor Systems

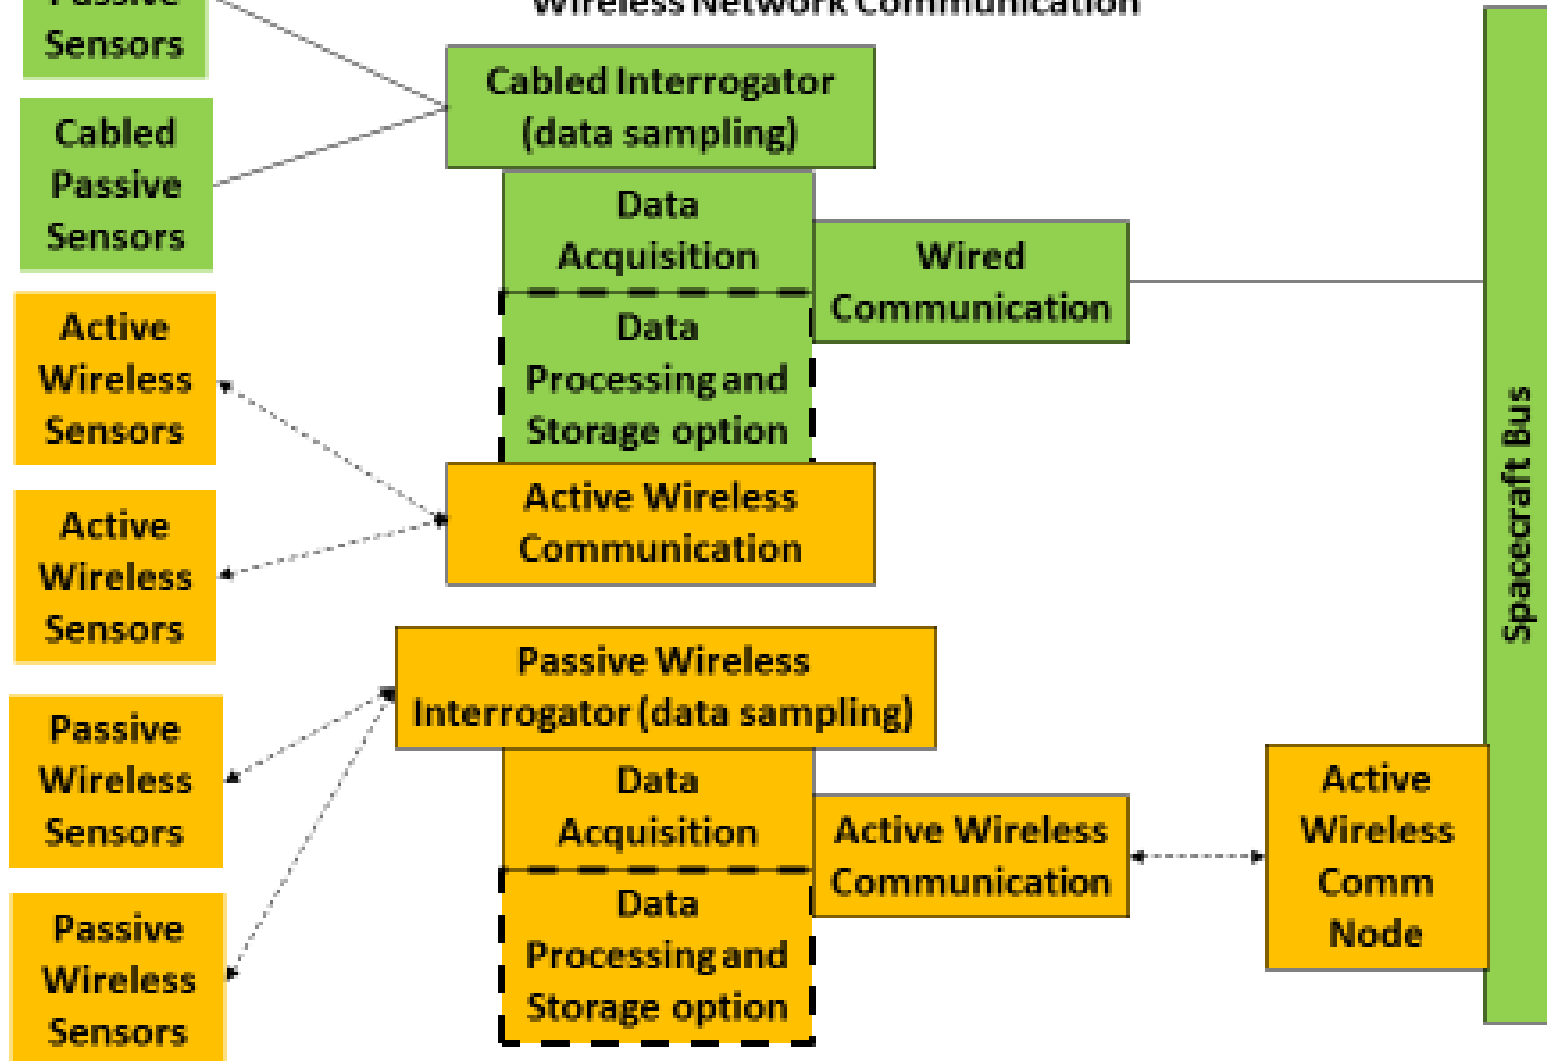

Active Wireless Sensor Systems.

- Add-on capability/simplicity
- Reduce integration costs/risks
- Distributed sensing/processing
- Reliability from network/backup
- Battery or scavenge power
- Low transmit power

Fewer Penetrations

Remote power sources

Illustrating Passive Wireless vs Active Wireless Sensors and Wireless Network Communication

This document contains ITAR, EAR, SBU, or limited rights data.

This is for status only and does not represent complete engineering analysis.

Passive Wireless Sensor Types

- **EM-coupling:** Simple – very short range (RLC, Magnetic Field/Ultrasonic)
- **RFID-based:** Range: less than a meter
- **NFC-based:** Near Field Communications – up to a couple meters!
- **SAW-based:** Surface Acoustic Wave reflection(s) + Antenna
- **BAW-based:** Bulk Acoustic Wave
- **Broadcast Power-assisted:** Meets many of the objectives of PWST
- **In/Across Metal Barriers:** Power & Comm - Magnetic Field - Acoustic Waves
- **Antenna Impedance-based** – longer range
- **Dielectric Resonators:** simple, high volume
- **60GHz:** V-Band metal dipoles in spray-on patches
- **Optical:** Active & Passive(Spatial Phase Imaging-no illumination required)
- **Visual Light Communications(VLC):** Li-Fi , LiFD (Light-based RFID)?
- **X-Ray:** Backscatter X-ray sensing?

Passive Wireless Sensor Technology Workshops

Purpose:

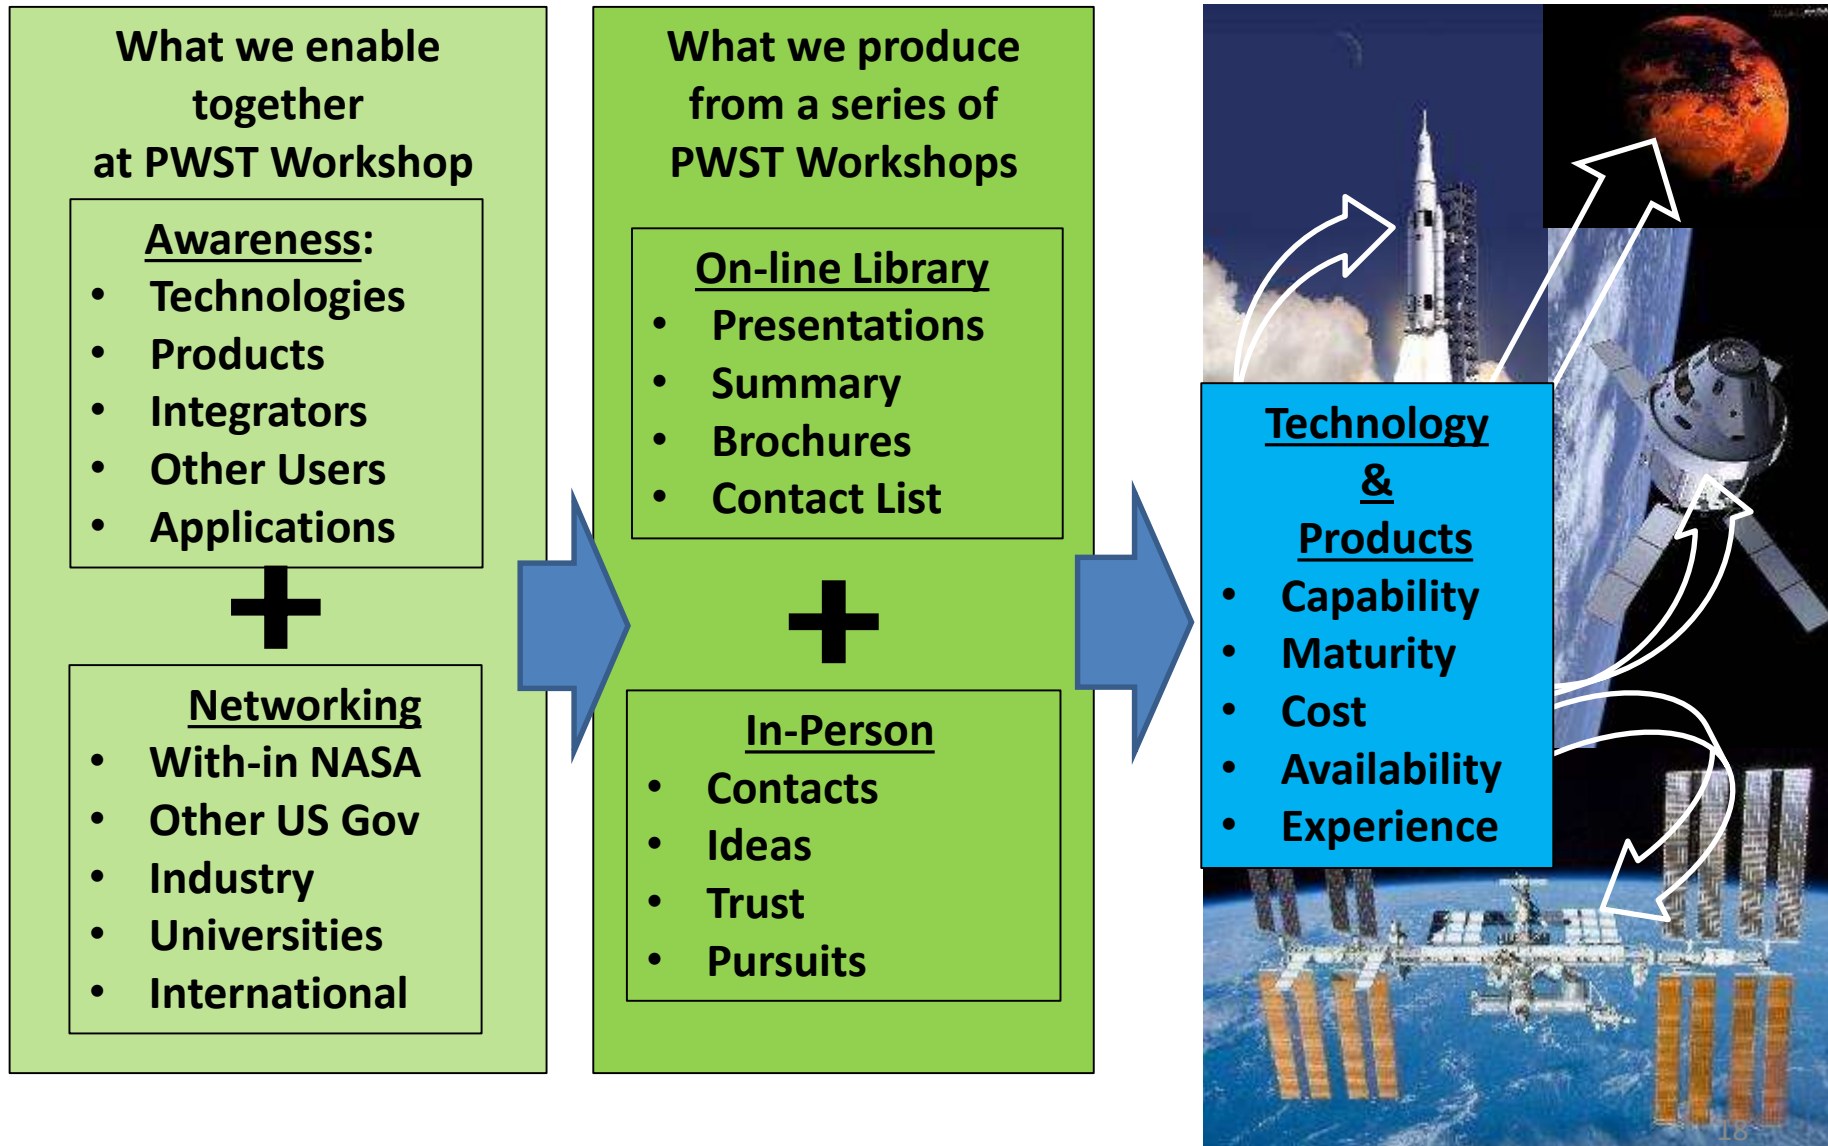

To bring Passive Wireless Sensor (PWST) technology developers, manufacturers and potential industry end-users together to understand the larger market drivers that will drive costs down and applications up. We will also discuss logical next steps.

Objectives:

- Understand various PWST technologies, actual & potential uses, and maturity.
- Assess the future applications/advantages/limitations in various industries.
- Assess what is needed for high volume production, standardization & communication.
- Precipitate individual & group “next step” thinking to further develop/apply PWSTs.
- Accumulate and Post a library of PWST publicly released presentations and contacts for potential partnering activities for everyone.

2013 PWS Workshop Agenda

May 21, 2013 – Day 1

Intro	8:00am - 8:15am	Univ of Central Florida	Workshop Intro	Don	Malocha
S1-P2	8:15am - 9:00am	NASA/JSC	Vision/PWS Workshops/SHM	George	Studor
S1-P3	9:00am - 9:30am	Canadian NRC - IVHM-DPHM	Canada-India Aerospace IVHM	Prakash	Patnaik
S1-P4	9:30am - 10:00am	NAVAIR- TDA, Inc.	Rotorcraft Metal-rich zones	Nagaraja	Iyyer
Break	10:00am-10:15am				
S2-P1	10:15am-10:45am	DOE-Oak Ridge Nat. Lab	Low Cost Wireless at ORNL	Wayne	Manges
S2-P2	10:45pm - 11:15pm	DOE-EERE-Building Tech Off	Low Cost Meter Challenge	Jason	Koman
S2-P3	11:15am -12:00pm	OnRamp Wireless Inc.	Connecting Anything	Ted	Myers
Lunch	12:00pm - 1:00pm				
S3-P1	1:00pm - 1:30pm	Rahrig Pacific Company	Environmental Services Tech.	Joe	Delaney
S3-P2	1:30pm - 2:00pm	Rahrig Pacific Company	Supply Chain Solutions	Kaley	Parkinson
S3-P3	2:00pm - 2:30pm	TMI USA, Inc.	Expanding Data Logger Uses	Chris	Hough
S3-P4	2:30pm - 3:00pm	Tufts University	Micro UAV Platforms	Usman	Khan
Break	3:00pm - 3:15am				
S4-P1	3:15pm - 3:45pm	GE Global Research	Multi-variable Sensors	Radislav A.	Potyraiolo
S4-P2	3:45pm - 4:15pm	RFMicron Inc.	Self Tuning RFID	Shahriar	Rokhsaz
S4-P3	4:15pm- 4:45pm	Univ of Louisville	Physical Switch Sensors	Cindy	Hartnett
	4:45pm - 5:00pm	Day 2 Plan - Wrap-up	Encourage Dinner Match-ups	Don	Malocha

2013 PWS Workshop Agenda

May 22, 2013 – Day 2

S5-P1	8:00am - 9:00am	Univ of Central Florida	PSW Technology – Today & Tomorrow	Don	Malocha
S5-P2	9:00am - 9:30am	ASR&D Corp	PWST-SAW Sensor Systems	Jackie	Hines
S5-P3	9:30am - 10:00am	TriQuint Semiconductor	Bulk Acoustic Wave Sensors	Josh	Zepess
Break	10:00am - 10:15am				
S6-P1	10:15am - 10:45am	GVR Trade SA	UltraWBSASensors&Tags	Victor	Plessky
S6-P2	10:45am - 11:15am	Univ of Maine	Smart Interrogators	Ali	Abedi
S6-P3	11:15am - 11:45pm	Gentag Inc.	NFC Sensors	John	Peeters
S6-P4	11:45pm - 12:00pm	CPIAC, Johns Hopkins U	JANNAF Sensor Database	Nick	Kiem
Lunch	12:00am - 1:00pm				
S7-P1	1:00pm - 1:45pm	Hydro-Tech	Magnetic Field PWS	Corey	Jaskolski
S7-P2	1:45pm - 2:15pm	3Phoenix	Thru Wall Comm & Power	Pat	Jordan
S7-P3	2:15pm - 2:30pm	Feedback/Wrap-up	Talk to Don/attendees	Don	Malocha
Break	2:30pm - 3:00pm	Re-Arrange Room for One-on-One Sessions			
	3:00pm - 5:00pm	One-on-One Sessions	1-on-1 Scheduled User - Developer discussions (Developers Signup for 15minutes blocks of time on User Schedules)		
	NA	Univ of Maryland	PWS Workshop Admin	Maice	Costa
	NA	George Mason Univ	PWS Workshop Admin	Hossein	Roufarshbaf

2012 PWST Workshop Presenters

#	Name	Organization	Role	Location	Title/Technology/Interest

2013 PWST Workshop

May 21 - 22, 2013

Presentation Summary Slides

NASA/JSC/George Studor

Location: Georgetown Melrose Hotel, DC

Sponsor: ISA Communications Division

Dr. Prakash Patnaik

“Sensor Applications to IVHM in Aerospace Systems”

prakash.patnaik@nrc-cnrc.gc.ca

National Research Council(NRC) Aerospace

613-991-6915 Principal Research Scientist Lead-Air Defence System Program, Ottawa, CA

Goal: Canadian Government stimulation of Infrastructure and industry through a **Complementary IVHM Demonstration Program**

- Levels: Vehicles - Systems/Structures – Enabling Technologies
- Complementary Non-Aerospace Partners/Applications

How: Technical Action Teams, Industry Action Teams

NRC Targeted Sector-wide IVHM Program

Target Consortia to facilitate – TIER 1 Companies, Research Centers
and Industry Canada

NRC-CANEUS IVHM Workshop - August 2012- Many Aerospace players present

Approach: Work Backwards from the Problem and Decisions to find the best sensor system

Roadmap for Health Usage Monitoring

Test facilities support increasing complexity

Wireless SHM: Failure precursors & monitor damage: lowest Cost, Weight, Complexity

Facilitate IVHM technology applications

Address both Technical and Regulatory(Certification) issues

Wireless Engine Performance, Prognosis, and Health Management – Data-Driven Models

Thin Film Sensors – design, fabrication, test and application

Flight Test Aircraft: Numerous

Energy Harvesting

“ Exploring Passive RFID System in Metal Rich Environments Application to Rotorcraft Dynamic Component Tracking”

Technical Data Analysis, Inc; Falls Church, VA
Director of Engineering

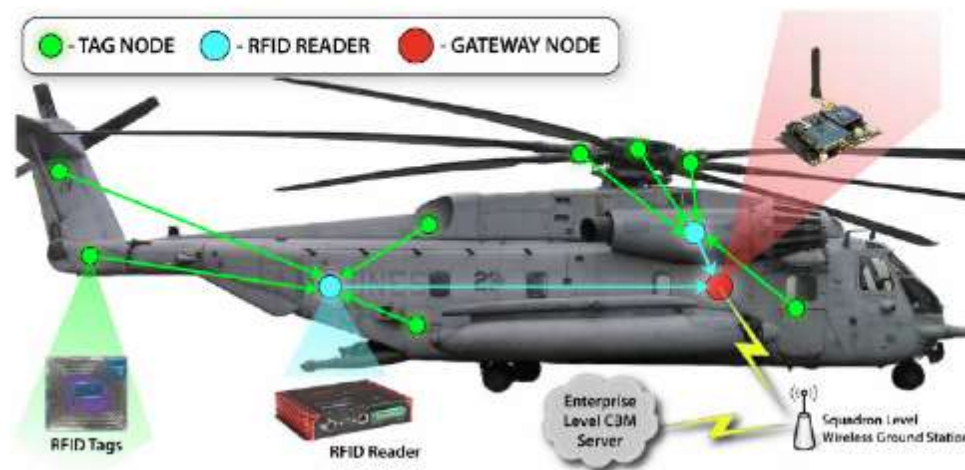

NAVAIR Customer – Driving Technology Needs; Multiple partners in R&D

- 1) Rotorcraft dynamic component structure life tracking with Passive RFID.
- 2) Improve passive wireless tag readability in a complex metal-rich environment
 - Dynamically adjust the scattering properties vs redesign
 - (a) boosting the back-scatter signal from passive tags with beam-forming and impedance matching techniques,
 - (b) boosting the back scatter signal from an auxiliary powering method
 - (c) developing a smart placement algorithm involving tag & reader-antenna.

▪ **Objective:**

“Develop an innovative system for tracking the structural life of rotary wing dynamic components in support of condition based maintenance (CBM) and unique identification (UID) mandates.”

10:15AM, May 21 - Day 1

Session 2 Presentation 1

Wayne Manges

“Low Cost Wireless Sensor Network Research at ORNL”

865-574-8529

Manager, Oak Ridge National Laboratory Industrial Wireless Program

mangesww@ornl.gov

Oak Ridge, TN

Co-Authors: Wayne Manges, Peter L. Fuhr, T. Kuruganti and T.J. McIntyre
Building Energy Efficiency needs Ultra-low Cost Wireless Sensor Networks

Low Cost? - <\$5/mote

- Developed custom chip set: includes sensors, electronic readout & telemetry
- Implemented Integration Architecture for Sensors, Controls and Building Automation Systems at CERL
- Supervisory Model Predictive Control Integrates Sensor Data, Control Set Points, Weather Conditions and Occupancy profiles

2012: ORNL deploys **“wireless suitcase”** at Alcoa (\$43 ea)

- 1) STM32F103 processor (two processor parts, pin & function compatible)
STM32F103VET6, 64K RAM, 512K Flash
- 2) Ethernet interface (RJ45)
- 3) NRF24L01 wireless interface (50m w/ 2dBi external antenna)
- 4) 2.8" TFT LCD and touchscreen
- 5) SHT10 temperature & humidity sensor
- 6) Li-poly battery with onboard charger circuit
- 7) 6x Analog inputs; JST 3 pin side entry connectors
- 8) RT-Thread operating system
- 9) realtime clock (RTC) with battery backup

Open Source Software

8 Servers x 6 Units/Server = 48 Sensor Nodes

2013: Wireless Suitcase at
- Ft. Stewart, Ft. Campbell,
and Dover AFB
- Environmental Sensing

2013: Growth Areas

- Printable Electronics, Antennas & Conductors
- PARC Sensor Tape
- Passive Wireless SAW
- Passive RFID Sensors

10:45AM, May 21 - Day 1

Session 2 Presentation 2

Jason Koman

“Low-cost Wireless Meter Challenge”

DOE/EERE

Jason.Koman@ee.doe.gov

BTO Building Technology Office

202-287-1578 http://www1.eere.energy.gov/buildings/commercial/bba_wireless_metering.html

DOE Building Technologies Office: Commercial Building Integration Team

Input from Several Federal Agencies

and

Better Buildings Alliance: 200 Members, 9 Billion Square Feet

Working with Better Building Alliance Technology Solutions Team

DOE Challenge Process: Identify the Issue -> Deployment Campaign

Build on Successful “Rooftop Unit Challenge”

Premise: Building Energy Efficiency Improvements need to be Measured Efficiently

Wireless Metering Challenge: reduce the price of panel level sub-metering

- Sub-meter monitoring is more focused and occupants can be more aware

Goal: 2% Savings = 71 trillion BTU/yr and \$1.7 billion/year all US Commercial Bldgs

Participants: Technology Developers provide prototype systems

Building Owners to host the Technology Demos

Formal Kick-off - May 20, 2013

11:15AM, May 21 - Day 1

Ted Myers

“Connecting Anything, a M2M Revolution”

Ted.Myers@onrampwireless.com

858 592 6008

Session 2 Presentation 3

On-Ramp Wireless, Inc

www.onrampwireless.com

Co-founder, Chief Technology Officer

Connecting Things that are Unconnected

Maximize Intelligence via Wide Area Automation

Random Phase Multiple Access (RPMA)

Coverage - > 1 access point can cover 400 Sq Mi

35 access points for 4,100 Sq Mi

Capacity - > 2000 nodes, uplink 100MBytes/day

Multiple Sensing Applications Operational

Electric/Gas Meters – above and below ground

RFID-GPS Real-Time Location System Tracking

Collection nodes for many types of sensing

Spreading factors 8192 chips/symbol - up to 39 dB of **processing gain – 172 dB of Link Budget**

Receiver sensitivity is **-133 dBm** on downlink and **-142 dBm** on uplink

DOE Paper: “*Smart Grid Automation for Underground Utility Assets Wireless System Trade Study*”

Coexistence

Recovery

Detection

Prevention

Attacks

NIST approved security until 2030

10-15 yr life

Power

1:00PM, May 21 - Day 1

Session 3 Presentation 1

Joe Delaney “Challenges in Solid Waste Collection Operations”

Rehrig Pacific Co

jdelaney@rehrigpacific.com

National Operations Technical Manager, Los Angeles, CA

315-727-1608

www.rehrigpacific.com

Better Asset Management can:

- Reduce costs
- Increase revenues
- Improve Customer service
- Positive impact on Sustainability

Current Technology: Millions deployed

Bar Codes, RFID tags, GPS tracking,
Asset Tracking SW, Customer Service SW

Current Uses:

Service Verification: Late Set outs, Overage, Improper set out, Contamination

Lost Containers = Lost revenue, Overage, Servicing extra, larger or non-revenue containers

Inventory Management, Ordering by demand, Min Container Loss, Scrap/Warranty Management

Collection Routing Efficiency: Inventory accounting, Time between trips, Various Statistics/Data

Recycling Participation - Reduce Fuel, Contamination, Educate Customers, Volume driven service

New Technology Needs:

Beyond Bar Codes and Current RFID(Passive Wireless Sensors?); Creative Service Verification ; Improved Asset Management; Volume or Weight tracking technology; Materials recognition capability; Improve Customer Accountability – Since the Customer is always right!

1:30PM, May 21 - Day 1

Kaley Parkinson [“Intelligent RTI’s for the Supply Chain”](#)

kparkinson@rehrigpacific.com

925-360-1950

Session 3 Presentation 2

Rehrig Pacific, Los Angeles, CA

Director, Supply Chain Technology Services

www.rehrigpacific.com

Intelligent Reusable Packaging for Real World Supply Chain

- **Cost per Trip Management**
- **Reduce Lost Containers**

Assets Utilization
Data is Made
Available via the
Web

Assets Are Scanned
Back Into Plant
Inventory via Readers
on the Inbound

Items are Picked
and Loaded Into
Assets for
Transport

Asset is Read During
the Pick Process at
Manufacturing and
Sent into the Market

Can Passive Wireless Sensors help with Real World Challenges?:

- Traditional reader networks on all gateway points
 - **too high a cost barrier** (100's of portals)
- **Too long of a payback** for cash-flow poor companies
- Scanning at the destination **too costly** (1000's of locations)
- Trading partners **unwilling to share costs**
- Third party distribution creates **information barrier/"hole"** in the network
- **Disruption** of current process flow
- **Costly integration** into existing systems
- **Information overload**

2:00PM, May 21 - Day 1

Chris Hough

chris.hough@tmigi.com

Session 3 Presentation 3

TMI USA, Inc.

Reston, VA

www.tmi-orion.com

"Expanding Data Logger Applications"

High Performance Data Loggers for Industrial Strength Applications

Zigbee 802.15.4 comm at 2.4GHz ISM

Variables:

Temperature
Pressure
Humidity
Air speed
Force
Electrical Current
Resistance
Distance
Water Activity

Industries:

Food processing
Pharmaceutical, Health care
Chemistry
Ceramic & Tile
High Heat – Brick, Foundry, Electronics
Aeronautics/Aviation
Manufacturing – Automotive, Mechanical

Brick/Ceramics

How to integrate Passive
Wireless Sensing with
current offerings?

Aviation

2:30 PM, May 21 - Day 1

Session 3 Presentation 4

“Micro-UAV Platforms for Structural Health Monitoring and Inspection”

Usman Khan, Assistant Professor

khan@ece.tufts.edu

617-627-5299

E & CE, Tufts Univ., Medford, MA

<http://www.ece.tufts.edu/~khan>

<http://spartn.ece.tufts.edu>

<http://www.youtube.com/user/SPARTNatTufts>

1. Wireless Accelerometers Monitor Dowling Foot Bridge at Tufts Univ
2. Sensors in each Substructure Transfer Relevant Info to RFID Tag

Can PWST Tags
augment this
monitoring scheme?

3. Quadrotor uses Optical Targets to Navigate to Substructure RFID Tag

RFID Tag

4. Quad-rotor Interrogates RFID Tag
5. Wipes RFID Data
6. Sends monitoring program changes
7. Proceeds to next substructure tag

https://www.youtube.com/watch?v=0AuF_Xj_Xms

3:15 PM, May 21 - Day 1

Session 4 Presentation 1

“Meeting Demanding Field-performance Requirements with Multivariable Flexible and Printed Gas Sensors”

Radislav Potyrailo

potyrailo@crd.ge.com

(518) 387-7370

Principal Scientist, General Electric Global Research Center

Niskayuna, NY

<http://ge.geglobalresearch.com/profiles/radislav-potyrailo/>

Multivariable sensors:

- 16-bit sensing resolution resides in sensor reader, not in disposable sensor
- Common platform for:
 - Phys/chem/bio sensors
 - Asset tracking
 - Storage of sensor calibrations

Markets \$ Billions

In vitro diagnostics	20
Clinical diagnostic instr & reagents	10
Chemical sensors and biosensors	4
Pathogen sensors	0.5
Food safety testing products	0.25
Environmental monitoring	0.05

Custom IC chips with Sensor Inputs:

Passive RFID

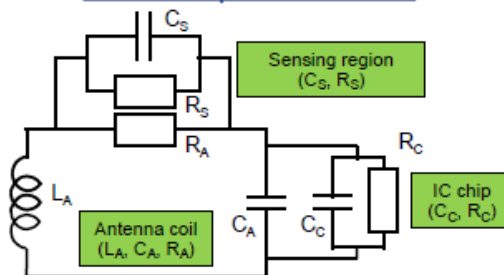

Smartphone with NFC Sensor

GE Strategy:

Individual Multivariable Sensors:

- Simplified manufacturing
- Reduced number of noise sources
- Simplified device packaging
- More predictable sensor aging

Sensor Equivalent circuit

3:45PM, May 21 - Day 1

Session 4 Presentation 2

"Passive Wireless Sensing Powered by Chameleon™, a Self-Tuning Technology"

Shahriar Rokhsaz

Pres. and CEO, RF Micron

shahriar.rokhsaz@rfmicron.com

www.RFMicron.com

Austin, TX

Magnus Chip:

- Wireless Comm
- Sensor Engine
 - location
 - environment
- RF Programmable, non-volatile Memory

Printable Antenna for sensing based on Impedance Changes

- Relative Humidity sensor:
 - Senses several wetness levels
- Pressure sensor
- Low cost Wet/Dry sensor
 - Reliable comm in deep water
- Proximity sensing
- Temperature sensing

Central Intelligent Unit RFM-Hermes

- based on UHF Gen 2

Sensor Code Adjustment WRT Humidity Decrease With Time

Magnus

5:15PM, May 21 - Day 1

Cindy Hartnett

cindy.hartnett@louisville.edu

(502) 852-0689

“Physical Switch Sensors”

Session 4 Presentation 3

University of Louisville, KY

Associate Professor, E and CE

<http://hartnettlab.wordpress.com>

WISP: Wireless Integrated Sensing Platform

- 1 mW for 1 ms.
- No battery but uses a capacitor

Presentation Topics:

- Design rules for creating bi-stable sensor elements for a given bend angle/size/wt range.
- A power-efficient method for scanning these flexible switch arrays with the with the microcontroller on WISP.
- MEMS and larger-scale fabrication methods for these devices.

Ohmic Contact Switches

Variable Capacitor AC Switch(memtronics.com)

- Algorithms for reconstructing a shape from an array of digital switch states.

Applications: flexible electronics and smart textiles.
shape of deployable structures

8:00 AM, May 22 - Day 2

Session 5 Presentation 1

Don Malocha "Passive Wireless Sensor Technology: Device & System Perspective"

donald.malocha@ucf.edu

E & CE, University of Central Florida, Orlando

407 823-2414

<http://caat.engr.ucf.edu>

This is a 78 page Tutorial on Passive Wireless SAW Sensors

SAW Resonator Tag(Frequency), CDMA Tag(Time)

Orthogonal Frequency Coding (Time & Frequency Diversity) - UWB

- Multi-frequency (7 chip example) - large number of codes
- Long chips, high reflectivity
- Orthogonal frequency reflectors –low loss (6-10 dB)

- Synchronous Correlator Transceiver - Software Radio
- Novel Coherent Multiplexed Receiver – with NASA/KSC
 - Applies Optical Coherent Technology (at coherence, output is maximum at correlator detector)
- Correlator Time Delay Extraction (CTDE)
- FUTURE FOR SAW SENSOR SYSTEMS

11:00AM, May 22 - Day 2

Jackie Hines

jhines@asrdcorp.com

410-544-4664

Session 5 Presentation 2

President, ASR&D Corp

Arnold, MD

www.asrdcorp.com

Experience:

Passive Wireless SAW Sensors – ID & Value – calibration & accuracy

Sensors that produce variable impedance and voltage

Temperature comes “free”

Strain, AE, Switch position, voltage

SAW-based Sensors: Humidity (reported PWST 2012),

Hydrogen, Methane, Hypergol

Cryo-liquid-level, concrete maturity

Biosensor for infectious agents

New Temperature Sensor System: NASA-MSFC SBIR

- Software Radio
- Simultaneously reads 32 sensors
- 8 to 55 foot range – antennas not optimized
- Time, Frequency (200-400MHz), & Code/Chirp Diversity
- In-situ Calibration of sensors needed.
- < 0.1 Deg C precision

Credit: MSFC/Jim Miller – NASA Retired

9:30 AM, May 22 - Day 2

Joshua Zepess

josh.zepess@tqs.com

541-382-6706

"Bulk Acoustic Wave Sensors"

Session 5 Presentation 3

TriQuint Semiconductor, Inc.

Bend, OR

www.TriQuint.com

	Quartz QCM	BAW 2 GHz	BAW 10 GHz
Res.Freq. (Hz)	30 x 10 ⁶	2 x 10 ⁹	1 x 10 ¹⁰
Area (cm ²)	1.0	6.25 x 10 ⁻⁴	2.5 x 10 ⁻⁵
Density (g/cm ³)	2.7	3.3	3.3
Shear M. g/cm*s ²	2.9 x 10 ¹¹	9 x 10 ¹¹	9 x 10 ¹¹
Sensitivity (Df/Dm)	2 x 10 ⁹	7.4 x 10 ¹⁵	4.6 x 10 ¹⁸

Shear AlN

50deg optimal

Future:

- Better Film quality
- Increase Q/sensitivity with more complex structures and novel materials
- Adapt to use with Std RFID

SMR BAW Sensor

- 100mm Si substrate
- SMR BAW resonator
- Standard eight layer oxide reflector
- Aluminum bottom electrode
- Titanium/Gold or aluminum top electrode
- Operating frequency of ~2GHz; tested up to 12GHz

10:15AM, May 22 - Day 2

Victor Plessky

+41 32 8463039

Co-Authors: M. Lamothe, V.Plessky, T. Ostertag, J.-M. Fried, and S. Ballandras

Session 6 Presentation 2

victor.plessky@gmail.com

Owner/Director, GVR Trade SA - Gorgier, Switzerland

www.gvrtrade.com

UWB Advantages:
More information
Signal processing
Small size
Low EM radiation

UWB 2.0-2.5 GHz

- Constant pitch transducer in parallel.
- Each sensor-tag has a 100MHz channel.
- Each channel is sized for his frequency.

Test Results:

- Reduced losses over LFM technique
- High side-lobes addressed by cross-correlation

200 MHz to 400 MHz

Linear Frequency Modulated (LFM).

Temperature Sensors
-5° C to 130° C
0.1 - 0.2° C precision

Research & Development

500 MHz

1m Range => US EM limits OK
Working on improved range

2.45 GHz

6.0 GHz

Russia: 5.650GHz-6.425GHz

CW Radar interrogates
2 UWB LFM tags, at different ranges

CW Radar

Reflective Environment :

- Sensor in metal can
- Measure spectral response
- Pulses from time-reversal method

Test Results:

- Sensor response is visible
- Compressed pulses are wide/noisy but identifiable-> **Cross-Correlation avoids Phase ambiguity problem.**

10:45AM, May 22 - Day 2

Ali Abedi

ali.abedi@maine.edu

207-581-2231

"SMART Interrogators"

Session 6 Presentation 2

University of Maine, Orono, ME

Wisenet Lab, Professor & Director

[http:// wisenet.eece.maine.edu](http://wisenet.eece.maine.edu)

Spectrum Management And Resource Timing (SMART) interrogators make efficient use of idle spectrum while allocating optimum power to the wireless interrogators.

Licensed Spectrum is idle 70% of the time.
Wireless network efficiency improvements

Concept: Allow, but manage interference

- Interrogate all, one or some sensors.

Challenges: Spectrum measurement
Time synchronization

124 wireless tags
(900 MHz) and 16
temp/humidity
s (2.4 GHz)

70 Member Team (2008-2011)

- Network Coding
- Coding Map
- Robustness
- Passive Wireless options
- Interrogate all, one, some
- Distributed Coding
- Cooperative Relays
- Latency Reductions
- Cooperative Cognition

Some Results:

Effect of relay channel quality

Effect of cooperation cost coefficient

11:15AM, May 22 - Day 2

John Peeters

john.peeters@gentag.com

240-994-2236

"NFC Sensors"

Session 6 Presentation 3

Gentag, Inc.

President and CEO

www.Gentag.com

Biosensors:

- Drug Toxicity
- Pathogens
- Allergens
- OTC Tests
- Cancer Detection
- Biomarkers
- Food Safety

Printable Pharma Sensors (pills)

GENTAG NFC PATCH

Diagnostic Skin Patches

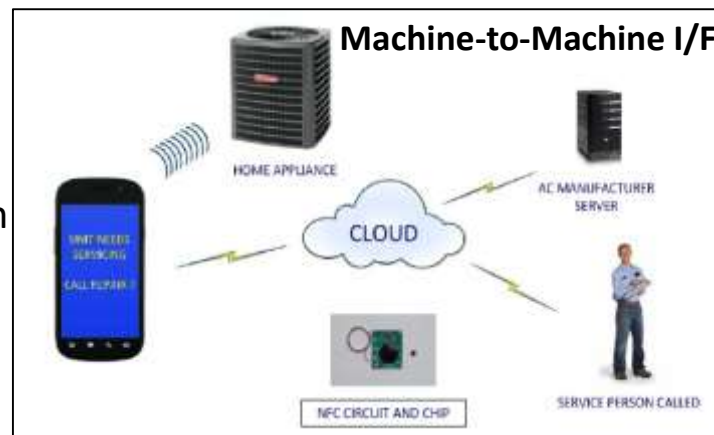

- Drug Delivery
- UV (sun) Exposure
- Skin Moisture
- Infections
- Diabetes
- Fever
- Cardiac

NFC Micro-controller (Custom ASIC)

- 13.56 MHz – Medical band
- NFC and ISO Standards
- No Battery for sensor
- Printable Sensor
- Read Range w Cell Phone(0.1W) = 8 cm
- Power to Sensor: 100microW & 1-3V
- Sensor Resistance change: 2K Ohm

Long Range Radar-Responsive Sensor-Tags

Physical Sensors (resistance change)

Nick Keim
443-718-5005

“JANNAF Joint Sensors Database”

nkeim@cpiac.jhu.edu

**Chemical Propulsion Information
Analysis Center, Johns Hopkins University**

May 2010 DoE NETL and JANNAF Integrated Health Management (IHM) and Engine Health Management (EHM) panels agreed to cooperate on a Joint Sensors Database

Goals:

- An online database for information on sensors with aerospace applications
- Collaborative data collection (users provide sensor information)
- Secure – For US Government and their US contractors
- Searchable based on criteria of interest
- Generation of side-by-side comparisons

Data to include:

Specifications – one set of specifications for a single sensor

Applications – many user provided application specific notes
(eg: environments a sensor has been successfully used)

**Here's a way to share
Passive Wireless Sensor
info. with high tech
potential applications.**

Benefits:

- Identify available sensors and successful implementations.
- Identify gaps in sensing technology.
- Leverage knowledge across agencies and industry on available sensors.
- Cross-pollination of sensor success from propulsion systems to energy generation.
- Identify & update TRL for particular sensors.

1:00PM, May 22 - Day 2

Corey Jaskolski

cjaskolski@hydro-tech.com

970-686-6200, 970-672-6616

Session 7 Presentation 1

President

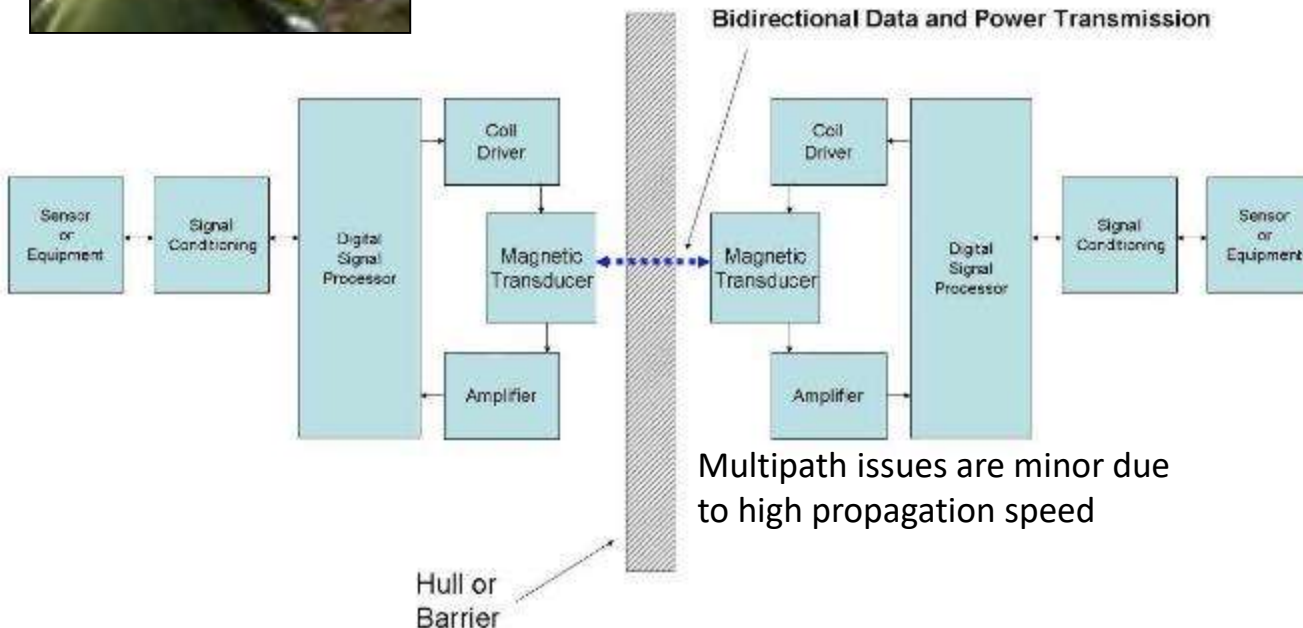

Hydro Technologies, Inc, Windsor, CO

www.hydro-tech.com

- Modulation of magnetic fields to transmit data and power.
- Works through metals (X65, 1010, Inconel, Super Duplex, Al), seawater, concrete, air, layers of multiple materials.
- Deployed on US Navy Los Angeles class submarine as part of a mission and safety critical system.
- Recent specific oil/gas applications & technology improvements.

**Passive
Sensor
“Puck”**

Material	Thick ness	Data R (kbps)	Power Xfer
304 S Steel	0.5"	500	5W
	1"	100	1W
Titanium	0.5"	500	5W+
Inconel	0.5"	500	100W
Aluminum	0.5"	100	<1W
Plastics low conductivity	0.5"	1,000+	5kW+
Steel (1010, X65, 4130)	1"	1	~1mW *
Steel (1010, X65, 4130)	7"	10 bps	-

1:30PM, May 22 - Day 2

Session 7 Presentation 2

Patrick Jordan

"Wireless Sensing for Survivable Machinery Control"

Patrick.Jordan@3Phoenix.net

Director of Surface Sonar Systems, 3Phoenix, Inc

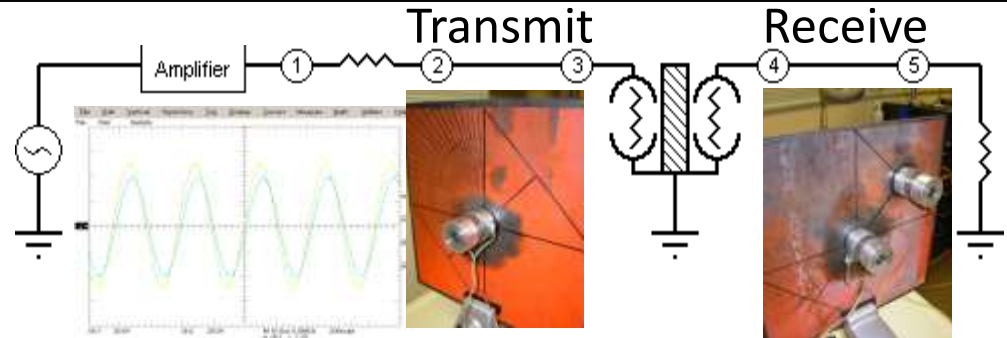

(730) 956-6480

<http://3phoenix.com>

Chantilly, VA

Acoustic Communications and Power Thru Bulkheads

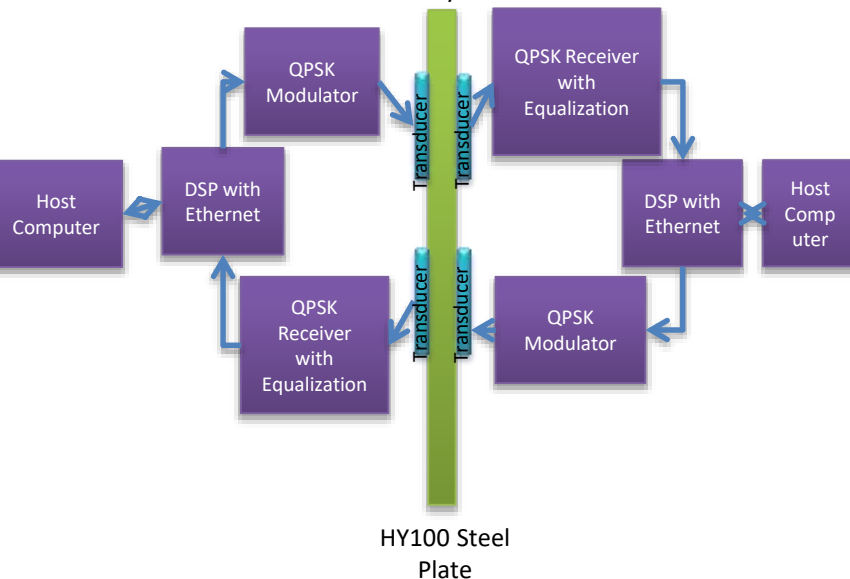

Comm at 4.5 MBit/Sec

Power:

- Average power transfer efficiency – 65%
- Achieved delivered power levels up to 9 W
 - Power levels of 10-15W easily achieved
 - 3-5W load power will provide longer life
- Operating transducers in parallel doubles the power delivered
 - Transducers with larger areas increase power levels
- Low to moderate power level requirements should result in long life applications
- Sinusoidal wave input power showed 5-8% improvement over square wave input

Bi-Directional System Architecture

HY100 Steel Plate

Passive Wireless Sensor Workshop

Day 2 One-on-One Session Opportunities

Table - End User

- 1 Shell
- 2 Canadian NRC - IVHM
- 3 ORNL Wireless Research
- 4 NAVAIR - TDA
- 5 Rehrig Supply Chain
- 6 DOE Low \$ Meter Challenge
- 7 Tufts Univ: micro-UAVs
- 8 TMI Data Loggers
- 9 Rehrig Solid Waste Cont.
- 10 On-Ramp Wireless

2012 PWST Workshop
Presentation Summary Slides
NASA/JSC/George Studor

June 6-7, 2012

Location: La Jolla, CA

Sponsor: ISA Communications Division

2012 PWST Workshop other Attendees

Name	Company	Role	Location
Doyle Carr	ATA		Arnold AFB
Elizabeth Adams	BP		Munster, IN
Scott Marston	Boeing	Wireless Cabin Systems	Bellevue, WA
Bob Lad	Environetix	President	Orono, ME
Kirk Galier	GE		
Nilesh Tralshawala	GE Global Research		Shenectady, NY
Raj Singh	Honeywell		Golden Valley, MN
Rama Budampati	Honeywell		Golden Vallley, MN
Aaron Trott	Invocon		Conroe, TX
Chuck McConaghy	Lawrence Livermore Nat Lab		
Mark Cmar	NASA	Plumbrook	
Nekheel Gajjar	Panduit Corp		Tinkley Park, IL
Kevin Thompson	Perpetua Power		
Peter Flanagan	Rosemount - Emmerson		Chanhassen, MN
Thanh Vu	Savannah River Nuclear Solutions		Aiken, SC
Joshua McConkey	Seimens	Seimens	Orlando, FL
Brian Schaible	Sporian		
Farokh Eskafi	Tagarray		
Paul Fortier	Univ of Massechusetts		
Haydn Thompson	Univ of Sheffield		Sheffield, UK
Tom Birnbaum	Wireless Sensor Technologies		
Steve Noro	Yokogawa		

1.2 ISA107.4 Wireless Sensors for Turbine Instrumentation Working Group

Daniel Sexton - RF Instrumentation and Systems Laboratory
GE Global Research Niskayuna, NY - sextonda@ge.com

Scope: Wireless Instrumentation for Turbine Engine Test Cell :

Scalable architectures, system components, protocols, secure reliable wireless connectivity for test cell-based, multi-tier, active data transmission and passive wireless sensing, harsh environments

Basis for **future on-wing** engine health monitoring or control systems.

Purpose:

- Define Wireless interfaces, physical and RF environment
- Develop Multi-vendor interoperability support for various applications
- Develop co-existence support – possibly with other network standards

Future Activities:

- Technology Assessment and Gap Analysis
- Develop Needs Areas for Standards and Best Practices
- Users/Develop community develops Documents

Benefits of Creating a Standard:

1. System simplification
2. Compatibility between vendor equipment
3. Consistency in measurements
4. Reduced testing time and costs

Wires are
a Common Problem

Level 0 - Engine (On/In-Engine – 1 ft)

Level 1 – Test Cell (Interrogators & Network – 50ft)

1.3 Wireless Technology for Aerospace Applications

Sanjay Bejekal – UTRC East Hartford, Conn. - BajekaS@utrc.utc.com

Wireless Needs:

- Long term health monitoring of the airframe and structures
- Short term health monitoring of targeted/specific issues using peel & stick sensors
- Security – resistance to intentional RF interference & protection from eavesdropping

Countermeasures:

- Frequency Hopping systems over large frequency bands (>500 MHz)
- Antenna Gain pattern (fixed and adaptive phased arrays)
- Adaptive Tx power control (burn through)
- Coding
- Novel Technologies (Magnetic comm, Free space optics, Higher freq > 40 GHz)
 - Mag comm can have 3 orders of magnitude less susceptibility to eavesdropping vs RF

Energy Harvesting:

- Combine sources – PV, Mechanical, Remote RF
- Power Storage – Ultra Capacitors or thin film rechargeable – Printed Zinc batteries

System Integration:

- Communication Range
- Protocols: Physical and Software Stacks

Passive Wireless Potential: Low Cost - Short & Long Term Health Monitoring, Security

1.4 Naval Applications of PWST from the End-user's Perspective

Robert Pritchard – Navair, NAWCWD China Lake robert.w.pritchard@navy.mil

Potential Uses of PWST:

- **Condition-based Maintenance**
 - Energy Autonomy – e.g. thermal scavenging for external skin sensors
 - Event Monitoring – e.g. munitions comm link integrity –voltage drop at umbilical
 - Energy Harvesting – e.g. helicopter blade damage, pitch link dynamic loads
- **Health Management/Monitoring and Inventory Management**
 - Ext Environment where munitions have been -Temp, Humidity, Vib, Shock, Chem, etc
 - Internal Conditions – Temp, Press, Humid, Stress/Strain, Chem, Corrosion, Leak, etc.
 - Detection, Identification, Location, Remote Sensing(Encryption for Security)
- **Anti-Tampering(DOD and DHS)**
 - disable LIVE/DUD munitions – remotely commanded or self-destruct
 - sense tampering
- **Power Systems:** Improve Isp, Mass Fraction, Cost, Uncertainty, Reliability
 - Novel Ocean(Thermal) Powered Underwater Vehicle – NASA/JPL
 - Energy Mgmt/System Control: Press, Temp, Power, RPM, Fuel Flow, Vol, Haz Gas
- **JANNAF sponsored Space and Military Wireless Sensor Systems Workshops**
 - Co-chairs: Pritchard and Dr. Tim Miller/AFRL - EAFB
- **OPNAV Ordnance RFID Implementation Policy(Aug 2008)**
- **List of Challenges, Approaches, Critical Measurements, “Low Hanging Fruit”**
- **Desirable Wireless Sensor Features and Approaches**

2.1 Passive Sensor Needs at BP

Dave Lafferty – Chief Technology Office - david.lafferty@bp.com

BP: Worldwide – Down-hole, Transport, Refine, Market – 80,000 employees

Fundamentals of Sensing: Deploy > Measure > Communicate > Take Action

PWST Applications that work/should work:

- Rotational Equip/ Shafts, Flames, Cement, Turbine Tips, Gas Detection,

Specific PWST Use Cases needing solutions:

- Corrosion Under Insulation (Indicators – Moisture, Humidity, Ph)
- Down-hole Cement between casing and rock(level, temp, strain)

Potential PWST Use Cases:

- Difficult to inspect locations
- Operating in hostile environments
- Extend the service life of assets beyond their designed life
- Reducing and managing risk via measuring the environment

2.2 Oil and Gas Asset Integrity Monitoring: the Needs and Challenges

Ron Cramer - Ronald.Cramer@shell.com

- Safety, Sustainability, Security, Ubiquitous Sensors
- Remote Sensing
- Health Care
- MEMS: versatile, powerful, reliable, cheap
- Measure any variable under multiple conditions
- Bring Cost Down, Performance Up
- Sub-Sea Integrity and Leak Detection

Approach

- Prior applications in other industries
- Conversion to O&G – Algorithms to convert signal to info
- Integration into a functional system
- Partnership with technology suppliers: industry & academia
- Quick route to failure – Game-changer

Sensor Elements

- MEMS for Vibration, acoustic detection, temperature
- SONAR, RADAR
- Magnetic detectors
- Ultrasonic

Common Systems

- Existing and emerging sensors
- Power generation and storage
- Signal conditioning and transmission
- Networking
- System architecture
- Data analysis

Systems

- Autonomous underwater vehicle
- Fixed subsea sensor networks
- Fixed acoustic/temperature/chemical/US sensors network onshore
- Versatile and expandable framework

2.3 Wireless Sensor Monitoring of Structures During Extreme Events

Fred Faridazar - Turner-Fairbank Highway Research Center (TFHRC) McLean, VA fred.faridazar@dot.gov
<http://www.fhwa.dot.gov/advancedresearch/index.cfm>

Exploratory Advanced Research Programs

David.Kuehn@dot.gov; terry.halkyard@dot.gov

- **Integrated Highway System Concepts**
 - International approaches: vehicle automation
- **Nano-scale Research**
 - Measurement of dispersion
- **Human Behavior and Travel Choices**
 - Dynamic ridesharing
 - Vision assisted technologies
- **Energy and Resource Conservation**
 - Sustainable underground structures
 - Electric vehicle commercialization
- **Information Sciences**
 - Video decoding, feature extraction
 - Probabilistic record linkage (data mining)
- **Breakthroughs in Materials Science**
 - “Self-healing” materials
 - Cement hydration kinetics
- **Technology for Assessing Performance**
 - “Smart balls” for autonomous culvert inspection
 - Pressure sensitive paints for aerodynamic testing
 - Remote sensing for environmental processes

Infrastructure

- Pavement Materials
- Pavement Design and Construction
- Long Term Pavement Performance
- Bridge and Foundation Engineering
- Hazard Mitigation
 - Flood, Seismic, etc.
- Infrastructure Management

Operations and Safety - david.yang@dot.gov

www.fhwa.dot.gov/research/tfhrc/programs/safety

- Human Factors
- Intersections
- Pedestrian & Bicycles
- Roadway Departure
- Speed Management
- Comprehensive Safety – Predicting Societal and
 - Complex Natural Systems

3.1 Machine-to-Machine Interfaces in Factory Automation

Cliff Whitehead – Rockwell Automation - cjwhiteheadjr@ra.rockwell.com

What if machines could report: their “health”?

- vibration of rotating equipment
- motor winding temperature
- oil or lubricant temperature or quality

their production?

- good parts or batches
- substandard parts or batches
- scrap or waste
- consumable materials used
- energy or utilities consumed

their “inventory”?

mechanical components
electrical components – including those
inside control cabinets
changeover parts
spare part requirements

their “location”?

work cell name
work cell unique identity
physical location inside the plant
operational status
safety status
upstream and downstream interfaces

Wireless in Automation Today:

Most prevalent in higher latency, non-deterministic monitoring applications

- Temperature, Flow, Vibration

Attractiveness stems from:

- Standard interfaces to well-established industrial network protocols (e.g., EtherNet/IP)
- Field-based devices for wireless interrogation and data translation

Challenges arise when speed is important

Summary:

Passive wireless sensing has promise for Factory Automation applications

The challenge is competing for mindshare with other wired and wireless technologies, and “the way it’s always been done”

Standards play a role by exposing user and technical requirements that can challenge our industry to advance our efforts to meet those requirements that are currently unmet is important

3.2 High Temperature Wireless Systems

John R. Fraley/Byron Western – Arkansas Power Electronics - jfraley@APEI.net

Why High Temperature Wireless?

- Data Collection from Rotating Components
- Increased SNR from Sensors
- Reduced Weight from Cabling
- Distributed Systems
- Improved Process Controls

Technical:

Enabling Technologies:

HTSOL: rated 225 °C and operable to 300 °C.

Wide Band Gap semiconductors up to 600 °C

Low Temp Co-fired Ceramic – multi-layer circuit

Energy harvesting Vibr, RF, TEG

Bearing Sensor Design

Blade Sensor Design

Testing Facilities:

Bearing Tests-AFRL

Spin Tests-Aerodyne

Overview:

Motivation

Applications:

Aerospace: HM for Bearings & Gearbox
Distributed Engine Controls

Geological Exploration: Temp, Press, Flow
Wireless Drill Head Control

Power Generation: Turbine Blades, Condition-
based maintenance, Smart Turbine Control

Industrial Processes: Manufacturing and
Chemical Process Monitoring

What's Next?

- Energy Harvester & Transmitter in Single Package
- HTSOL and SiC ASICs
- Integrated Sensors
- Improved Power Conditioning

3.3 PWST Needs At Yokogawa

Penny Chen – Yokogawa Corporation of America -
penny.chen@us.yokogawa.com

Future PWST Measurement Needs:

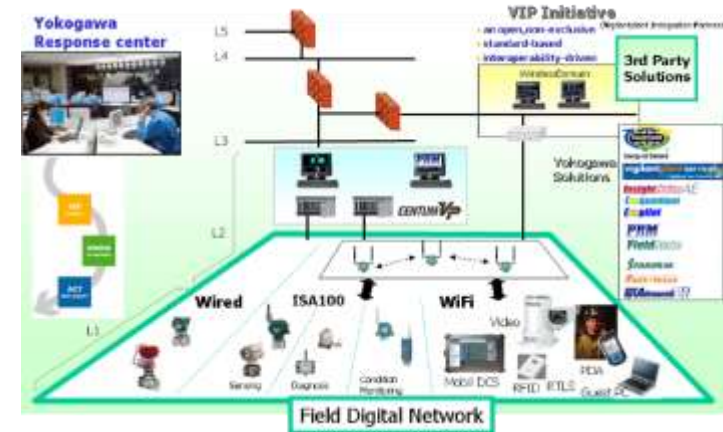

Corrosion
 Humidity
 Optical, Infrared
 Pressure, Tension
 Gas, CO2, Smell
 Vibration
 Acoustic Emission
 Temperature
 PH, Liquid Level, Flow
 Location, Proximity
 Valve position

PWST Challenges:

- Industrial environment :
- Life reliability & stability
- System scalability
- Robust, secure wireless
- Large Data Volume
- Low initial entry cost
- Variety of sensor types
- Coexistence w/wireless
- Open standards

Vigilantplant:

See Clearly
 Know in Advance,
 Act with Agility

	Requirements	Key technologies	Our Solutions
4:Application	<ul style="list-style-type: none"> -Full Automation -Full Navigation -Opt. Performance 	<ul style="list-style-type: none"> -Simulation -Advanced HMI (3D, MM, VR) -Production Traceability 	<ul style="list-style-type: none"> - Scenario-based Operation - Augmented Reality - Predictive Navigation - Advanced Optimization
3:Control	<ul style="list-style-type: none"> - Robustness - Integrity - Flexibility 	<ul style="list-style-type: none"> - Asynchronous Control Algorithm - Predictive control 	<ul style="list-style-type: none"> -palc-PID for continues control block -Shadow function block -APC, Opt. controller
2:Connection	<ul style="list-style-type: none"> - Reliability, Robust - Deterministic - Min. Latency, Jitter - Scalability - Interoperability 	<ul style="list-style-type: none"> -Full Redundancy (Duo cast, Gateway) - TDMA scheduling - FB communication 	<ul style="list-style-type: none"> - Redundant Gateway - Star topology by Duo cast / dual BBR -MM comm. On BBR - Reliable/long range Radio Comm.
1:Device	<ul style="list-style-type: none"> - Long Battery life - Growing Intelligent - Function block 	<ul style="list-style-type: none"> - Higher battery Capacity - Low power consumption -Energy Harvesting -Diagnostics -Intelligent Application 	<ul style="list-style-type: none"> -Standard battery case/pack with long life -Zone1 replaceable battery -Extending antenna cable -High gain antenna

4.1 Passive Wireless Sensor Technology for SRS Material Storage

Michael Mets - Process Controls and Automation Technology,
Savannah River Nuclear Solutions, LLC - michael.mets@srs.gov

**SRNS: M&O Contractor, DOE Savannah River Site, Aiken SC Nuclear
Materials Storage Mission:**

- Handling, Storage & Surveillance of Plutonium and other NM

Challenges for RF Systems:

Regulatory Environment

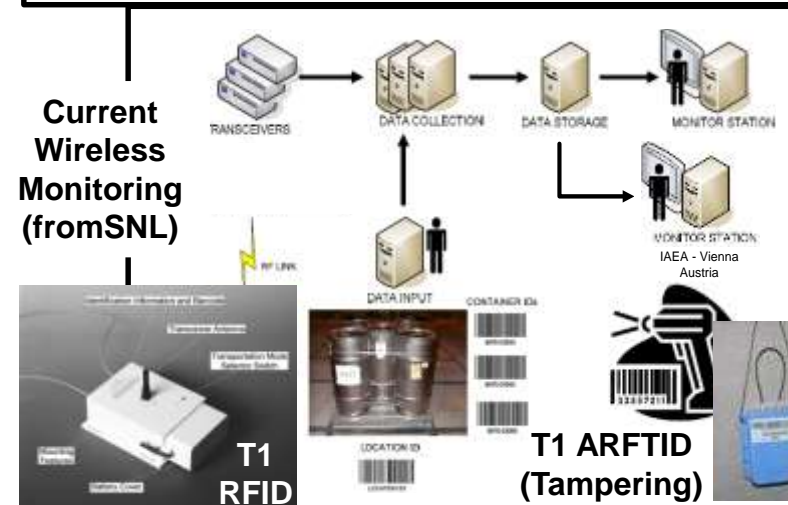

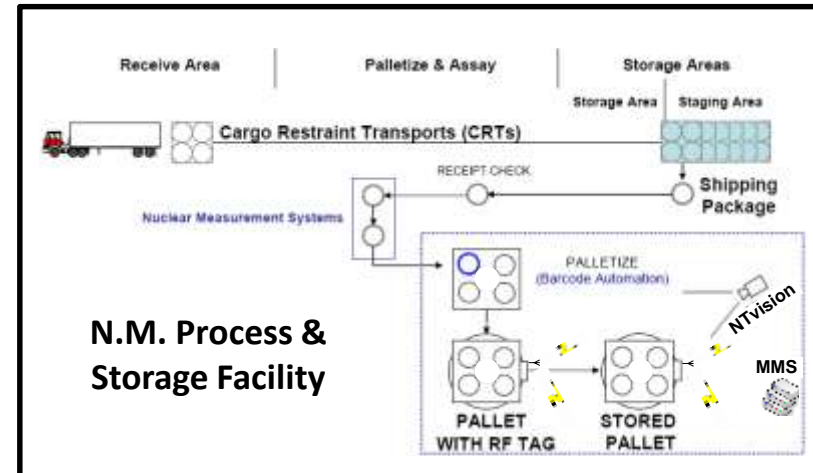

Spectrum Supportability Auth.
Procurement Authorization
Risk Assessment
Security and Test Plans

Physical Environment

Reflective & Attenuating Surfaces
Various Sources of EMI
Coexistence with Legacy Equip.
Harsh Environmental Conditions
Significant Radiation Levels

Passive Wireless Sensor Wish List

- Low cost <\$500
- -40° to +85° C ambient ops
- RF low power
- Security (AES 128-bit encryption) - NIST
- Authentication (AES 128-bit CMAC) - NIST
- Store messages locally
- Fiber optic loop (up to 50m)
- Remote data collection
- Real time clock
- Tamper detection
- Radiation Monitoring and Reporting
- Temperature & Humidity Monitoring

NEW: Remotely Monitored Seal Array(RMSA)
- 902MHz - Sandia N. Lab

ARG-US RFID
- Argonne N Lab

4.2 Introduction to On-Ramp Wireless

Jake Rasweiler – On-Ramp Wireless - jake.rasweiler@onrampwireless.com

“Ultra-Link” Technology

Applications:

- Utilities, Smart Grid
- Process Industries
- Personnel and Asset Tracking
- Critical Infrastructure

System Goals:

- Lowest Total Cost of Ownership
- Best Coverage in Industry
- Connectivity in Hardest to Reach Areas
- Immense Capacity
- Seamless Support for Battery Devices
- Robust Operation in Noisy ISM Band

Performance Metrics:

Coverage
Capacity
Coexistence
Power
Security
Cost
Deploy Schedule?

Application Type	Data/Day	#Nodes per AP*
Electric AMI Meter	2.4 KB	20,000+
Hazardous Alarms	100 bytes	100,000+
Pressure Sensor	100 bytes	100,000+
Cathodic Protection	100 bytes	100,000+

Installations: stationary during RF Ops, underground, in containers or Indoors, wide area coverage

AP Simultaneous Up & Down-link

AP Up-Link of User Data:

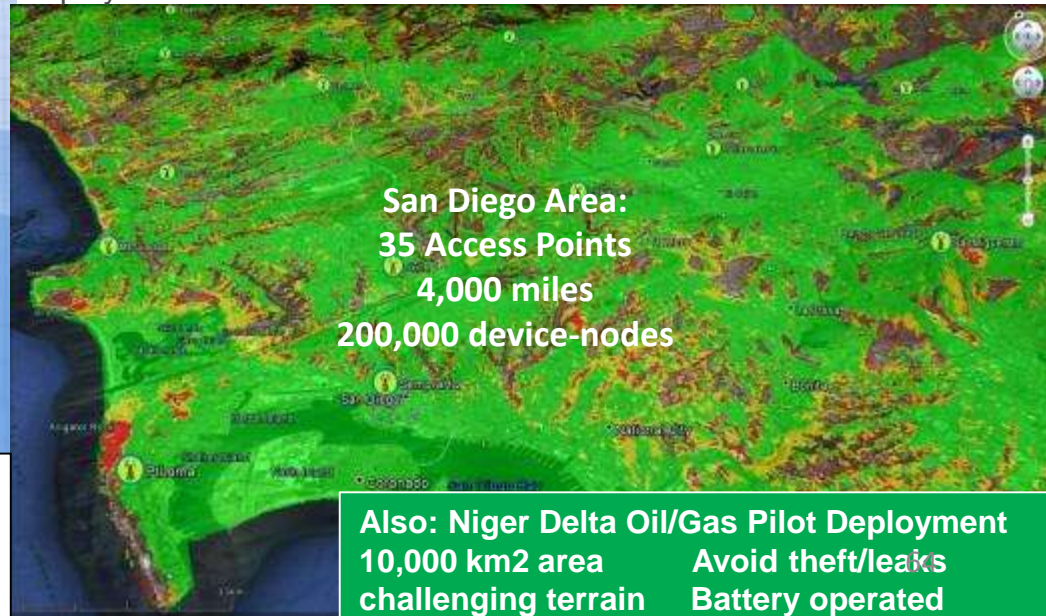

- 100 Mbytes/day
- 2,000 Nodes simultaneously

AP Down-link of User Data:

- Unicast: 72 MBytes/day
- Multi-cast: 144 kBytes/day
- Broadcast: 72 kBytes/day

Device Nodes:

-90 kBytes/day - 2.7% throughput for Electric meter – DSSS works fine

DSSS: Spreading factors up to 8192 chips/symbol
gets up to **39 dB of processing gain**
Receiver sensitivity is -133 dBm on downlink
-142 dBm on uplink

4.3 Integrating Wireless Sensors with Existing Data Acquisition Systems

Chris Gibson –VTI Instruments, Irvine CA - cgibson@vtiinstruments.com

What is important to End Users?

(Wireless Opportunities in Red - Bold)

Gen Purpose/High Speed Data Acquisition

- Cost/channel
- Accuracy
- **Ease of Use**
- **Quick test setup and teardown**
- Ability to distribute across large area
- Turnkey software, or min development effort
- Software tools to roll their own application
- Data processing done post test
- Continuous sampling important (no gaps)

Modal Ground Vibration Testing

- Distribute the measurements close to the structure
- **Cables add mass and damping, I need to manage this**
- Simultaneous sampling -eliminate channel/channel phase skew
- The ability to move lots of data is very important
- Turnkey software is historically required
- Data is analyzed in the frequency domain
- Move raw data and have the PC do the analysis/processing

Rotational Machinery and Order Analysis

(Turbine Generators, Drive Train, Transmissions, Windmills)

- Repeatability of measurements is a must
- High performance Tachometer inputs simply setup
- **I need to measure rotating mass**
- Data will be re-sampled for order domain analysis
- Phase angle/sampling , Tach accuracy important for balance ops
- Turn key software solutions are desired
- Distributed Sensing
- Software tools that they can use to roll their own application

Typical VTI Test Sites

- Jet engine Test Cells
- Rocket engine Test Cells
- White Good Manufacturers
- General Automotive Testing
- Battery/Solar Cell Testing

- Help me clean up the mess of wiring
- I don't like slip rings, give me a better way
- The cables effect my measurements
- How do pass cables through barriers

Static Structural and Fatigue:

- **The ability to place the instruments close to the structure to minimize cable lengths**
- Synchronization for improved data understanding in the event of a failure
- Front end configuration flexibility, support multiple transducer types (load, strain, pressure, displacement)
- **Scalability is critical - these can become very large tests**
- Turnkey software is preferred, ease of use
- **Help me manage channels for large test configurations**

Temperature Testing/Test Cells

- Repeatability of measurements is a premium
- Temperature accuracy
- **Easy connectivity, mini-TC simplifies setup**
- OTD shows failed channels before critical testing
- Measurement stability, some tests last for a long time
- Distributed measurements ease setup and reduce noise
- Real time limit checking with alarm or shutdown capability
- Software tools that they can use to roll their own application

4.4 Protected Spectrum for Wireless Avionics Intra-Communications

Radek Zakrzewski – AVSI Project AFE73 Chair - radek.zakrzewski@goodrich.com

A350: electrical systems

Typical wiring installation in A380 crown area (above ceiling panels)

About 30% of wiring can be potentially substituted by wireless

A380-800 wiring:

- Total wire count: ~100 000
- Total wire length: 470 km
- Total weight of wires: 5 700 kg
- Add 30% more for **wire mounting**

Motivation:

Reconfigurability: Efficient cabin or other changes/upgrades(e.g. Wireless – relocatable-Oxygen Supply Unit)

Safety: Dissimilar or Added redundancy, Fewer mechanical failures

Efficiency/Environmental: Less fuel burned due to reduced weight

Reliability: reduce aging wiring, data for aging aircraft

Challenge: Obtain Protected RF Spectrum World-wide needed for aircraft OEMs to install RF systems
(License-free – ISM – bands not suitable for safety-critical uses)

Aerospace Vehicle System Institute(AVSI) Consortium – www.avsi.aero – David Redman

WAIC – Wireless Avionics Intra-Communications – On-board, not air-to-ground, air-to-air, air-to-space

Project AFE73 – began in 2008 – **Members:** Airbus, BAE Systems, Boeing, Bombardier, Embraer, Goodrich, **Goals:** Gulfstream, GE Aviation, Honeywell, NASA, Sikorsky

- Develop Technical justification and broad support for Protected Spectrum request - ITU-R
- Receive Protected Frequency for WAIC systems world-wide at World Radiocommunications Conference

Progress: **WRC-12 (Feb 2012) adopted and Agenda Item for WAIC, WRC-15 will vote on proposal in 2015**

ITU-R M.2197 Report: http://www.itu.int/dms_pub/itu-r/opb/rep/R-REP-M.2197-2010-PDF-E.pdf

WRC15 Agenda Item: http://legacy.icao.int/anb/panels/acp/wg/f/wgf26/ACP-WGF26-WP13_WAIC%20AI%201.17%20draft.doc

Next: Detailed Sharing Studies must be accomplished in preparation for 2015.

5.1 “Passive Wireless Sensing in a High-Multipath, High-Doppler Environment”

Bruce Montgomery – Pres. Syntonics Corp - Bruce.Montgomery@syntonicscorp.com

RF Propagation in Jet Engines:

RF Transmission Testing:

- GE CF6-50 at WPAFB
- Small: GD F-16 engine, Large Boeing 747 engine
- Circular Polarization and Radial Polarization
- Signal loss can be less than in free space's $1 \div R^2$
- Signal Energy is spread out in time: initial and reflections
- Investigated EM “Windows”
- Multiple reflection time corresponds to 3x compressor size
- Time domain: Discerned Individual stages, not blades
- Internal compressor propagation is axial, not circumferential or spiral
- “Cutoff” frequency – for F16, 30db losses below 5.2 GHz

RF Modeling:

- Inserted “scatterers” at several points between transmitter-receiver
- Added waveguides to Model

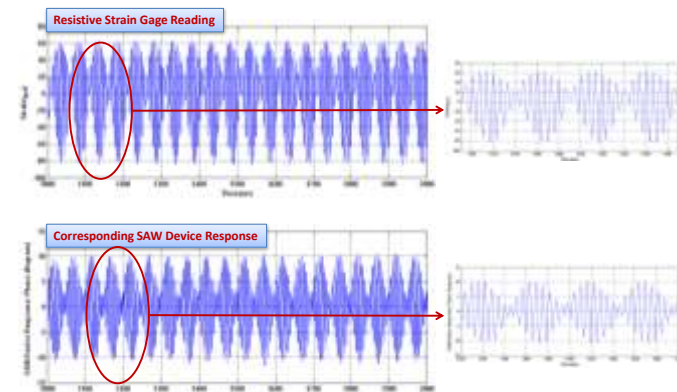

RF Passive Sensor Testing:

SAW device and resistive strain gauge Measurements the same

- Cantilever Strain Measurements

- Harmonically Driven

5.2 “Wireless Passive Strain Sensors Based on Surface Acoustic Wave (SAW) Principles”

Fred Gnadinger – Pres&CEO Albido Corp - fred@gnadinger.com; www.albido.com

Navy STTR Program
ONR COTR – Scott Coombes

Albido Passive Wireless SAW Sensors

Coded

Large bandwidth, high speed

Large read range

Small, rugged, cheap

Noise tolerant, no cross sensitivity

Low loss and variable frequency

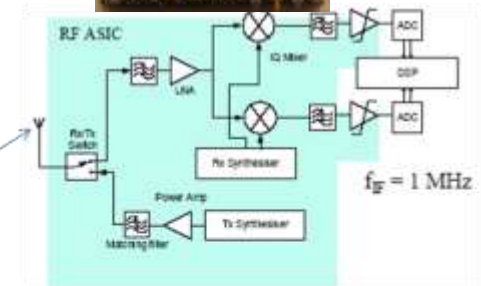

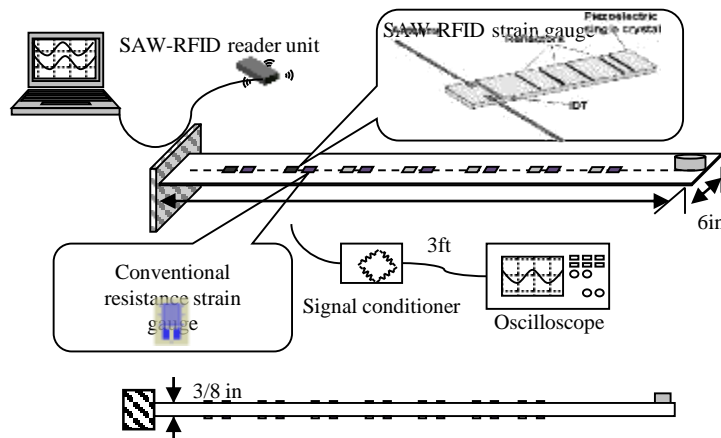

Radiation hard for space applications

Physical, chemical and biological parameters

Wide temperature range and harsh environment

- new temp compensation method

Cantilever Strain Test:

Reader

1cm x 1cm
Strain Sensor

5.3 “Wireless Microwave Acoustic Sensor Systems for Harsh Environments”

Mauricio Pierera da Cunha –Environetx- mdacunha@environetix.com www.environetix.com

Environetix Passive Wireless SAW Sensors

- Stable and reliable operation up to 900oC (1650oF)
- Wireless RF interrogator electronics
- Custom installation on rotating or static parts
- User-friendly data output on laptop PC
- Proprietary sensor packaging and attachment
- Multiple strain and temp sensors - integrated RF antennas
- Dyn Strain, pressure, corrosion , pressure sensors in work
- RF Frequency: 100MHz to 1GHz depending on need
- LANGASITE LA3GA5SIO14 Piezoelectric crystal
 - Stable up to 1400oC - Thermal shock resistant

Demo s at Power Plants, Furnaces, Engine Exhausts
- up to 1200oC (2200oF)

EVHT-100 for multiple
Temperature Sensors

temperature range:
accuracy:
resolution:
long term drift:
operating life:
insensitivity to press:
operating frequency:
sampling rate:
rotation:

150oC (300oF) to 900oC (1650oF)
±10oC over full range
within ± 5oC
< 1oC / 150 hours
> 500 hours
0 to 750 psi with < 1oC error
100 MHz to 1 GHz
1 Hz to 100 kHz
up to 53,000g's

90,000rpm
53,000 G

ARMFIELD CM-4

GE CT7 / T700

TMC85-1

JETCAT P-70 & P-80

5.4 “Passive Direct-write Sensors”

Mike Newton – nScript- mNewton@nscriptinc.com - www.nscriptinc.com

Printed Electronics + 3D Additive Manufacturing = Direct Print Additive Manufacturing

Print what you can....place what you can't.

Micro-Dispensing/direct printing:

- High speed
- As fast as 500mm/sec.
- Wide range of material choice:
- Viscosity from 1cps to >1 million cps.
- Many Types of materials
- Capability of high resolution and accuracy
- Pico-liter level column control
- Line as small as 20um, dot as small as 75um.

Applications:

- 2nd Generation TDRSS
- Print and Play Monolithic Satellite
- UAV monolithic strain sensor
- Magnetometer
- Vibration Sensor
- Electronic Circuits
- Solar Cell Mfg
- Metal loaded silicone
- **Passive Wireless Sensors??**

3D Print n Play Monolithic Satellite

Mixture, by volume:
25% DSM Somos 11122
75% Ceramic powder

Syringe for
Loading,
mixing,
storing,
dispensing

6.1 “Advances in SAW Devices for Sensing and RFID Applications”

Paul Hartman – RFSAW Inc. -phartmann@rfsaw.com - www.rfsaw.com

Global SAW Tag (GST) - SAW-based passive RFID – 2.44GHz

- Longest passive sensor reading range
- HERO certified for safe use on munitions
- Anti-Collision Matched Filter Processing
- Temperature tolerant Codes with Cross-correlation (i.e. anti-collision)
- Range-dependent zones – group similar tag response magnitudes using times of arrival

Actual 96-Bit Wireless Tag Waveform

Potentially 240 SAW Temperature Tags:

- 5 Codes
- 6 Ranges
- 8 Directions(Antennas)
- Reader switches from one antenna to the next
-

8 Port Reader

6.2 “PWST SAW - Sensor System”

Jackie Hines – VP ASRDC Corp. jhines@asrdcorp.com - www.asrdcorp.com/
Applied Sensor Research & Development Corporation

Wireless SAW Sensor Advantages:

- Operate wirelessly RFID capable
- RF signal activates sensor,
- Require no batteries Sensitive/accurate
- Perform multiple real-time measurements
- Last a long time (decades)
- Survive & operate in extreme environments
- Cryo to 1,000°C RadHard to > 10 MRad
- Low cost
- Established technology
- High Volume - Billions of devices sold/year for cell phones

=> **Enable low cost distributed sensing**

SAW Sensors under development @ ASRDC

- Coded sensor-tag wireless interface devices
 - use variable impedance input from Std sensors
- Humidity - Today's Focus
- Hydrogen
- Temperature
- Methane
- Hypergol leak detection(MMH, DMH, NTO)
- (Cryogenic) liquid (level)
- Concrete maturity monitor
- Biosensor for infectious agents (CT)

Passive Wireless SAW Humidity Sensor System

- Temple developed quick response sensor from Nanoparticle PVP/LiCl-doped TiO₂ films

DSSS codes with time, frequency diversity – 32 T sensors

Discrete Frequency Coding (DFC) – 8 good codes

Time Diversity - Re-used each code at eight distinct time delays

Orthogonal chips at each freq. have different delays to produce codes

Similar to OFC, but with code “chips” in frequency bands that do not overlap

Relative Humidity measured, need to add temperature compensation

System Delivered to NASA KSC, making improvements – deliver Nov 2012

Advances in Sensor-tag Coding

13-bit Barker code with time & frequency diversity – 100 sensor-tags

DSSS codes with time, frequency diversity – 32 T sensors

SBIR Phase 2 Temperature Sensor System(32) to NASA/MSFC – 2013

- Time integrating correlator-based Transceiver
- Power spectral density of response measured half-passband integrated energy

6.3 ""SAW PWST: 915 Mhz Sensor System and Demonstrations"

Don Malocha – Univ of Central Florida - malocha@mail.ucf.edu

UCF Progress:			2 dBi antenna Isotropic Range (m)	Data Transfer Rate (sec)	Post Processing Rate (msec)/sensor	Plotting and Overhead (sec)
Year	Hardware	# Sensors				
2008	UCF	1-2	< 1	5	>1000	2
2009	UCF	1-2	1-3	2	>1000	2
2010	UCF & MNI	1-4	1-4	0.5	500	2
2011	MNI	1-6	1-5	0.5	100	2
2012	MNI	1-8	1-7	0.5	10	2
2013	MNI and ?	1-16	1-10	0.5	5	?
2014	MNI and ?	1-32	1-50	0.001	1	?

Sensors: temperature, range, strain, hydrogen, magnetic, liquid, cryogenic

Environments: isotropic, hallways (60m), faraday cage (.5x.5 m), anechoic

UCF Fast Prototyping <1 week from idea to device prototype

RF Transciever – more parts are making it faster and cheaper to develop

UCF Correlator Synchronous Transceiver- Software Radio (2004-2010)

- Pulse Interrogation: Chirp or RF burst
- Integration of multiple "pings" OFC processing gain
- 915 MHz sync transceiver(Mnemonics, Inc) to NASA/KSC – STTR

Dual Track Gas Sensor: (On-board Sensor) Ref to left and thin film sensor to right)

Magnetic Puck for Closure switch sensor (On-board)

Antenna used as Closure sensors (Off-board)

Matched Filters to reduce noise, Correlator Time Delay Extraction(CTDE)

- S/N determines the precision and accuracy

Adaptive Temperature Correlator

Range: Current: 5meters; Future: 250m – 800m

High Temperature SAW devices on Langatate (LGT) - stable up to ~1450°C

- Platinum thin/thick films under investigation

Sawtenna development

Acknowledgements

NASA/KSC Dr. Bob Youngquist

SAW Temperature
Sensor

- **Passive** and **Wireless**, non-invasive and no active electronic circuits
 - Save 20%-80% of industrial wire installation costs (est. US \$130 – \$650 /m)
- **Medium & High** temperature operating ranges: -20°C to 120°C & up to +260°C
- **Reading Distance:** 0.1 to 3 Meters (depend on the antenna and RF environment)
- **System accuracy:** $\pm 2^\circ\text{C}$ (temperature operating range -20°C to 120°C)
- **Robust, reliable, stable and suitable for harsh**, hazard and inaccessible hot-spots
- **Multi- Communication Protocol:** RS485, RS232, USB, CAN. Analog-Output, MODBUS
- **User Friendly**, ease of installation, simple to use Interfaces and data logging
- **Real-Time** and Continuously Thermal Monitoring – 24/7/365
- **Miniature:** small and light, low cost
- **Low Maintenances**
- **Low ageing degradations** ($\pm 2^\circ\text{C}$ <12 years)
- **Environmental** and green technology – no recycling of battery

7.3 “RFID Tag Antenna-Based Sensing”

Isaac Ehrenberg – MIT Auto-ID Labs - yitzi@mit.edu; Rahul Bhattacharyya - rahul_b@mit.edu
Prof Sanjay Sarma

KSW semi-passive RFID temperature logger (>\$3)
www.variosens.com

➤ Keeping Tabs on Things:

➤ Why RFID?

- Proven track record of pervasive deployment
- Low cost RFID tag manufacturing
- Standardized reader-tag communication
- Free adoption in RFID-enabled processes

➤ 2 Concepts:

Use Reader-Tag Signal Parameters for Sensing

AM: Use Reader Power or Tag Backscatter

FM: Use Freq shift in Tag Response

Applications:

Temperature: perishables in cold chain

Temperature, Humidity and Shock on large scale

- Temperature Threshold Sensor

- Fluid Level Sensor

Low-cost, non-electric Memory

Normally, Passive RFID Tags can't record events when unpowered

- Permanent Change to Antenna(e.g. damage) = memory - Temp Threshold Sensor

- Temporary Change: Shape Memory Polymers – Glass Transition Temp – flexible vs rigid
Diaphragm or Antenna Detuning metal – changes Tag Backscatter (AM)
Fluid in a glass(Deavors 2010)

Note: Other Inventions Potyrailo 2010, Siden 2007, Caizzone 2011

8.1 “Passive UWB: Long Range, Low Cost and Precise Location”

Kourosh Pahlavan – TagArray - kourosh@tagarray.com www.tagarray.com

Motivation:

- Cost Effective: Total cost of ownership 100x less than GEN2 or active RTLS
- Zero Watt Passive Transceiver: Tag consumes < 2 μ W when communicating
- Accurate Location and Long Range: 2-3 inch resolution from 100 meters away

How it Works:

1. Beacon is a Narrowband UHF Transmitter
2. Narrowband signal powers Tag, initiates query session - 4W EIRP: 10m range
3. Receiver harvests RF power and wakes up
4. Tag transmits UWB impulses - 6dBm: 50-100m range
5. UWB Receiver(Single Chip/ Very Low Cost) uses Digital Antenna

Advantages:

- Small Cost & Size: UWB Readers are 100x and 20 times smaller than Gen2
- Read Range: 50-100 meters
- Resolution: 2-3 inches
- Sample Rate: 1000s of reads per second per reader
- Multi-path Immunity:
 - Robust tag detection/location determination
 - Signal propagates through openings and cracks
- Low Power: Tag chip consumes ave of 2 μ W (memory incl)
 - Alt power options: micro solar cell, MEMS harvesters, etc.

Status:

- Available: Tag, Reader and Software
- Next: Increase DA sensitivity to achieve 100m range
- Tag Antenna, Reader, Software for many tags, FCC cert

Applications:

- RTLS & Indoor tracking
- RFID
- Sensors
- Surveillance

Tag 1mm x 1mm

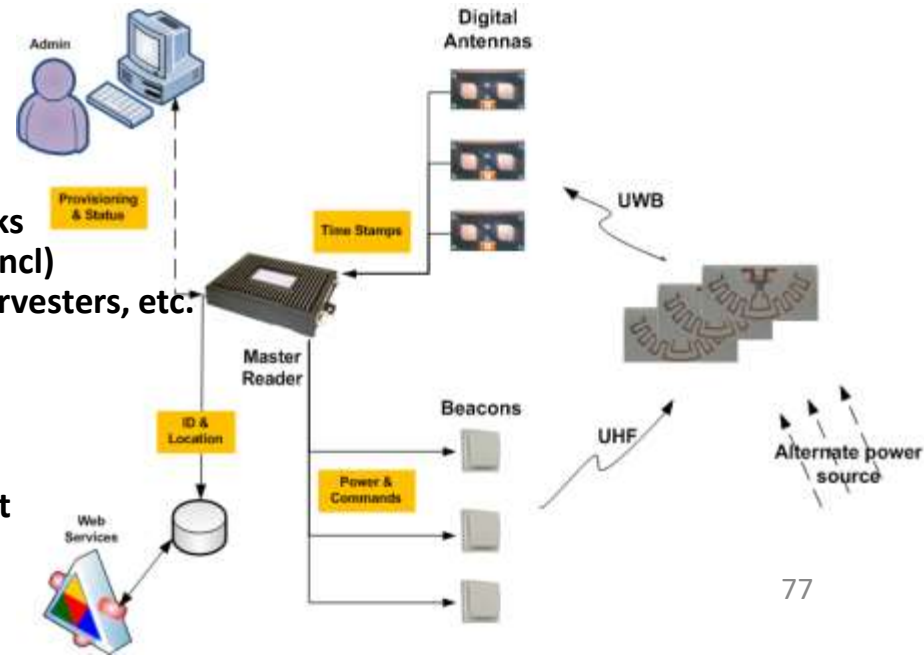

UWB Ant

UHF Ant

Reader 1mm x 1mm

8.2 “60 GHz Comm, RFID - moving to Passive Sensors”

Don Kimball – Maxentric - dkimball@maxentric.com www.maxentric.com

ViFi- V-band wireless Fixed and Mesh Network

Unlicensed at 59-64 GHz in many countries

Low SWaP at high freq

Directional Antenna

- Highly Reflective inside metallic enclosures like spacecraft

Order of magnitude better than 2.4GHz in satisfying HERO

(Hazards of Electromagnetic Radiation to Ordnance)

atmospheric resonance attenuates signal beyond 100-300 ft

Mesh Network: Ad-hoc Mesh, High Data Rate(>Gbps), Delay Tolerant (Memory-based), Ethernet Compliant

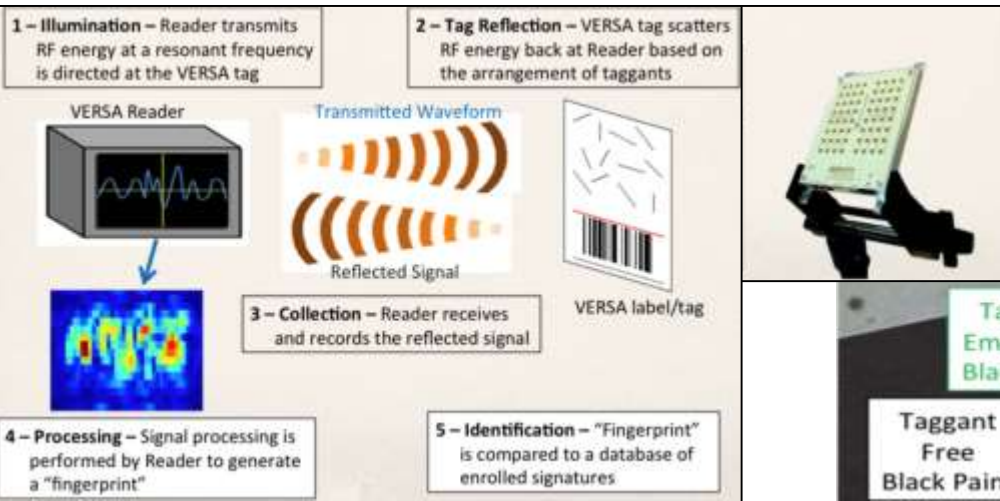

Gbps and adjustable to 10 Mbps

VERSA - V-band Enhanced RFID/Sensing

metal dipoles called Taggants – tiny for high freq

- Tag-response based on: Taggant orientation & Relative positions

Temperature, Pressure, Voltage, Location & Orientation

- 1.3

- Thin

8.3 “Wireless Temperature Sensors for Gas Turbine Engines”

John Conkle - Wireless Sensor Technologies - jrconkle@att.net

Problem:

- Catastrophic Failure caused by degradation and damage to hot section components
- Poor characterization of degradation process affects the development of durable components

Users:

Jet Engine Developers, Users, Maintenance
Other harsh environment applications - control and CBM applications in carbon, steam, or nuclear-fueled power plants.

Requirements:

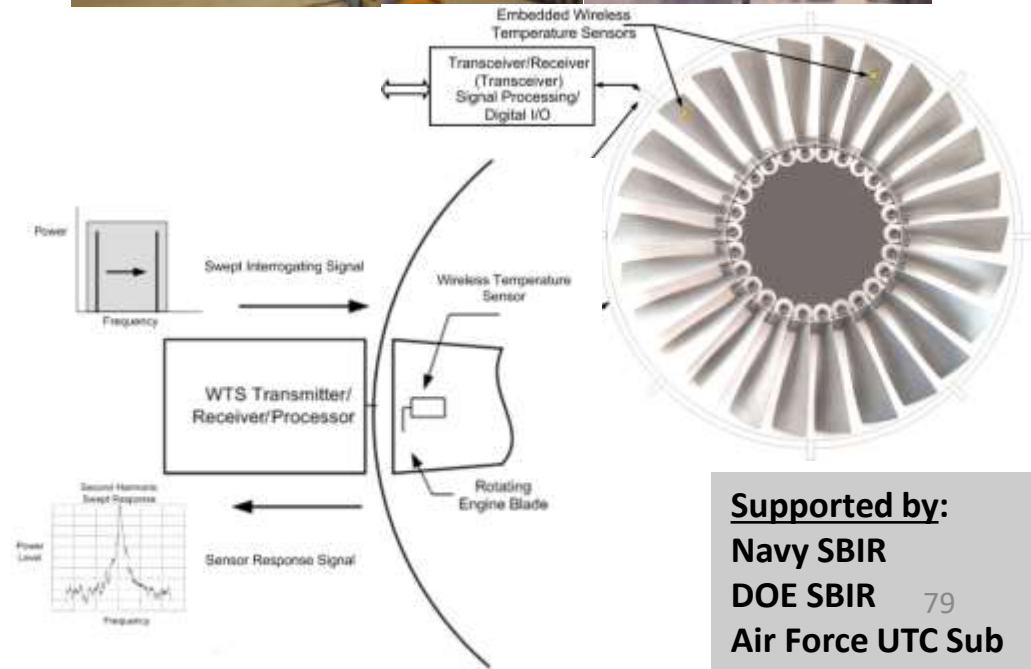

- Accurate temperature measurement
 - 10° C accuracy, Range of -60 to 1300C
- Long-term reliability
 - ‘00’s of hours for developmental testing
 - “000’s of hours for PHM and CBM application
- Easily mount on turbine blade or target surface
 - “Massless” and “Zero” height

WST Solution:

- Sensor Printed like an IC out of Alumina
- Antenna,
- Ceramic Dielectric, AZO Schottky Diode
- TRL5 in Fall 2012

In-Engine temperature surface data critical for:

- Propulsion Health Monitoring (PHM)
- Condition-based Maintenance (CBM) that has been mandated for use by the DoD
- Developmental testing of new engine designs

Supported by:

Navy SBIR
DOE SBIR
Air Force UTC Sub

8.4 “A System Engineering Simulation Tool and Data Base Proposal for Optimizing the Application of Wireless Sensors”

Scott Hyde – Aerojet - Scott.Hyde@Aerojet.com www.aerojet.com

Machine-to-Machine (M2M) Market Lesson’s Learned

- M2M communications consists of using a device to capture an “event” relayed through a network to an application, translating the captured event into meaningful information.
- Similar problems to Aerospace: too much to communicate, systems are inflexible, system cost
<http://www.machinetomachinemagazine.com>

Power of Simulation and its Role with Wireless Sensing

Simulation Reduces Upfront Costs and Pays Off Through the Systems Life-Cycle by Facilitating Assessment of Change Requirements, Impacts Due to Obsolescence and Software/Hardware Upgrades

Elements of a System Architecture can be Simulated with High Fidelity Enabling Management of System Complexity and Communication Congestion – Physical Level, Logical Level, System Level

CPIAC Sensor Database :

- Chemical Propulsion Information Analysis Center (CPIAC) is developing a secure, online, portal for the collaborative collection and dissemination of sensor related information.
- Access has ITAR restrictions (U.S. Citizens only)
- Sponsors: NASA , US Air Force and US Department of Energy
- CPIAC to Design, Implement and Host/Maintain an Online Tool for JANNAF to:
 - Allow the secure exchange and collection of information on sensors
 - Wiki-like functionality: Users create new entries based on standard forms
 - Documents can be attached as references for each sensor
 - Search capability based on keywords or filtering by criteria
 - Data reviewed prior to posting by an approving authority
 - CPIAC to perform initial data population using NASA sensors database

**Include
Active and Passive
Wireless Sensors?**

**Add an ISA or other
External database to
complement it?**

Wireless SAW Sensor Strain Gauge & Integrated Interrogator Design

Awarded – Apr 27, 2012

TECHNICAL ABSTRACT

The proposed Wireless, passive, SAW sensor system operates in a multi-sensor environment with a range in excess of 45 feet. This proposed system offers unique features in two (2) important areas. The first is in the development of a new sensor type, a strain gauge that is based on OFC techniques and implemented with the low loss characteristics of SAW Unidirectional transducers. The second is in the design of an integrated interrogator system that has DSP-based embedded signal processing. Interrogator will also be capable of rapidly performing multiple interrogations which can then be used to make vibration measurements or averaged to extend the operational range of the system. This proposal extends the Phase I and previous work in two major areas; developing a SAW strain sensor, and dramatically increasing interrogation range, which is applicable to both the new strain sensors and the previously developed temperature sensors. In order to increase SAW sensor range, sensitivity and accuracy, the most important device parameters were identified and initial investigation begun in Phase I and will be put into practice in Phase II. To reduce SAW sensor loss and minimize multi-transit acoustic echoes, low loss unidirectional studies were initiated. Phase I produced three alternative low-loss approaches that will be evaluated in the Phase II work. Success will lower the insertion loss by approximately 15 dB, and multi-transit echoes are predicted to be less than -40 dB from the main signal; doubling the system range and reducing the sensors self-noise. Advanced coding techniques were investigated in Phase I that have led to longer delay path lengths, and shorter codes with less inter-sensor interference.

During Phase II, the interrogator will improve the following critical capabilities: onboard-fully-integrated DSP, extended connectivity options to customer's computer, and rapid interrogation capabilities. This will allow vibration sensing and signal integration.

2-1 Multivariable passive RFID sensors:

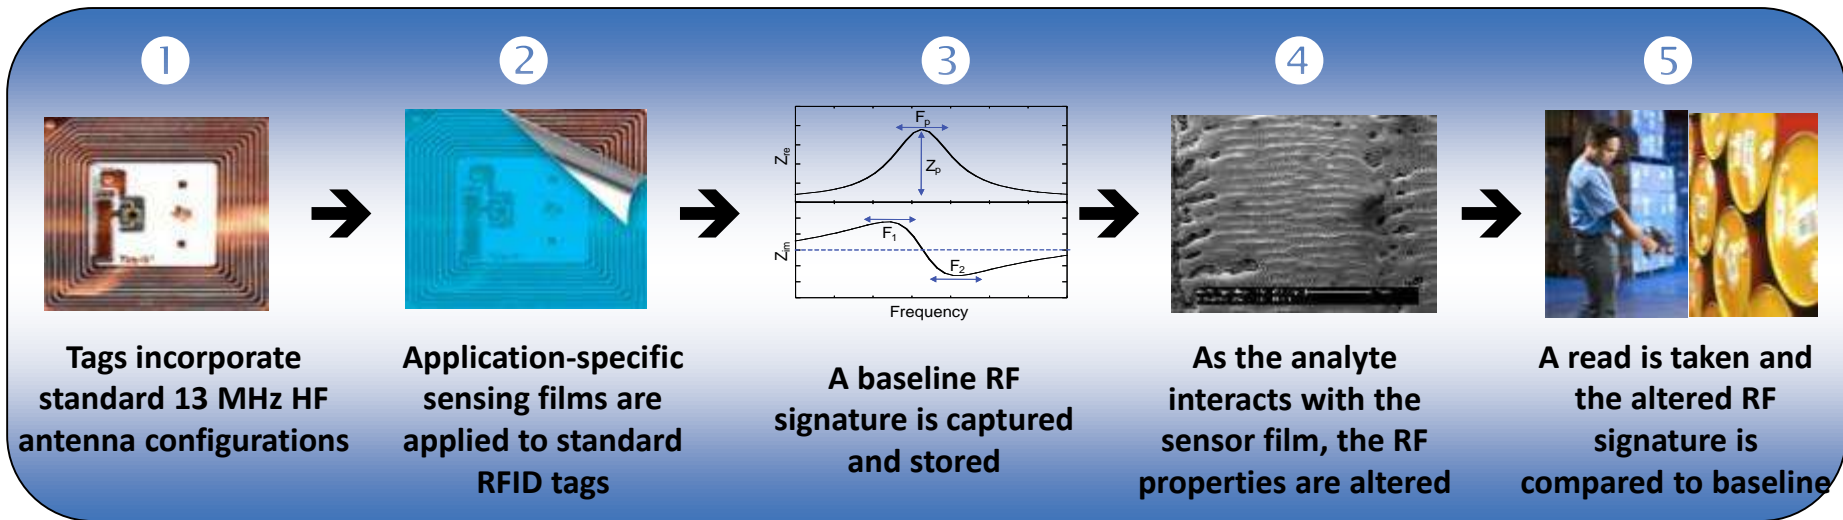

From detailed laboratory evaluations to pilot-scale manufacturing

GE Global Research/Cheryl Surman(surman@ge.com)

Avery Denison/Peter Bloch(peter.bloch@averydennison.com) - <http://ge.geglobalresearch.com>

How it works:

- GE RF Sensing utilizes the complex waveform of an existing high-frequency (HF) RFID technology as a signal transport.
- The reader interrogates the sensor tags, interprets the waveform, and determines measurement value.

2-1 Feb 2012 Analyst: “Multivariable passive RFID vapor sensors: roll-to-roll fabrication on a flexible substrate” Radislav Potyrailo, Andrew Burns, Cherly Surman, D.J. Lee, Edward McGinniss

We demonstrate roll-to-roll (R2R) fabrication of highly selective, battery-free radio frequency identification (RFID) sensors on a flexible polyethylene terephthalate (PET) polymeric substrate. Selectivity of our developed RFID sensors is provided by measurements of their resonance impedance spectra, followed by the multivariate analysis of spectral features, and correlation of these spectral features to the concentrations of vapors of interest. The multivariate analysis of spectral features also provides the ability for the rejection of ambient interferences. As a demonstration of our R2R fabrication process, we employed polyetherurethane (PEUT) as a “classic” sensing material, extruded this sensing material as 25, 75, and 125- μm thick films, and thermally laminated the films onto RFID inlays, rapidly producing approximately 5000 vapor sensors.

We further tested these RFID vapor sensors for their response selectivity toward several model vapors such as toluene, acetone, and ethanol as well as water vapor as an abundant interferent. Our RFID sensing concept features 16-bit resolution provided by the sensor reader, granting a highly desired independence from costly proprietary RFID memory chips with a low-resolution analog input. Future steps are being planned for field-testing of these sensors in numerous conditions.

2-2 Compliance Independence– is this the passive revolution?

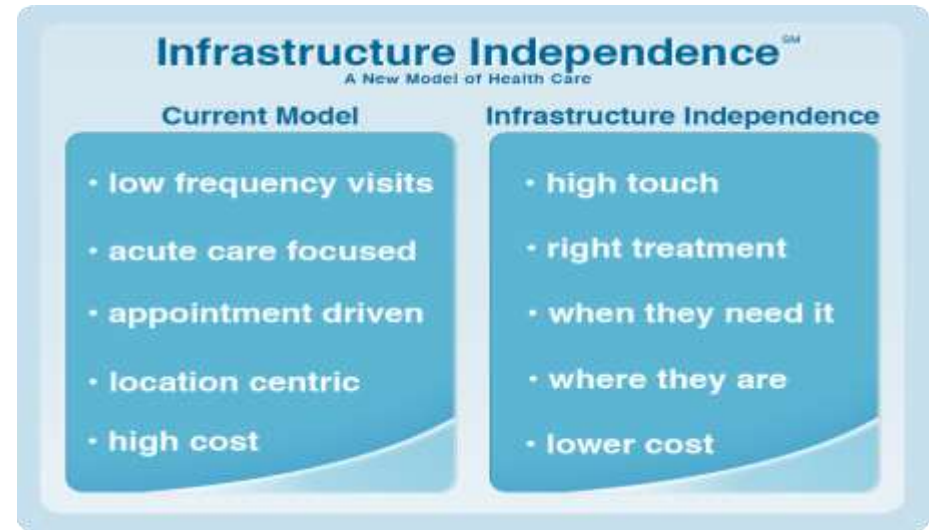

West Wireless Health Institute/Robert Matthews - CTO

<http://www.westwirelesshealth.org/rmatthews@gmwhi.org>

■ Primary Mission: Lower Health Care Costs

PWST Application Areas:

- Smart patient ID
- In home/office sensors
- On body sensors
- Medication compliance

Sensors in the bed:

Pressure – management of bed sores

Weight – identify weight gain (fluids)

Heart rate – various diseases

Motion -- various diseases

Wetness – need to change bedding

Patient ID – Once a day, some patient is mis-identified.

Patient Info: Who, what, when

- Allergies, genetic information
- What and when medications were take
- What batch of blood etc

Desired PWST Attributes:

Very Cheap -- cents (disposable)

Long range (100's ft)

Non-trivial power for sensors without risk to patients

Buffer power for use whilst not being illuminated

Store significant amounts of data (both read and write)

HIPPA compliant

Very small, Mechanically flexible

Reliable/Robust

Configurable

Easy to integrate

West Wireless Health Institute 2012 Update(from website)

West Wireless Health Council

SAN DIEGO – February 15, 2012

A new coalition of hospital and health system leaders to create a standard approach to installing wireless infrastructure in health care settings and develop innovative solutions that will enable the full potential of wireless health technology to be realized in health care delivery settings, and ultimately lower health care costs.

- Inherent Tag Localization

SAW Sensor and Sensor-tag Developments at ASR&D

Jackie Hines/ASRDC

jhines@asrdcorp.com - www.asrdcorp.com

Demonstrated sensor devices for:

- ◆ Temperature ◆ Liquid (level) ◆ Humidity
- ◆ Hydrogen ◆ Sensor-tags (strain, T, V, etc.)

Products under development:

- Coded sensor-tag wireless interface devices
- Humidity sensors
- Hydrogen sensors
- Temperature sensors
- Methane sensors
- Hypergol leak detection sensors (MMH, DMH, NTO)
- Cryogenic Liquid (level) sensors
- Concrete maturity monitor
- Biosensor for infectious agents (CT)

Systems:

- 32 tag humidity sensor to KSC Sept 29, 2011
- 32 tag temperature sensor system SBIR Phase 2 – begun June 2011 to MSFC

“VERSA” Resonant Passive Tags

MaXentric – Brian Woods

bwoods@maxentric.com - www.MaXentric.com

V-band Enhanced RFID Sensing Architecture(VERSA) Tags: 24 or 60 GHz

- VERSA tags are completely **passive**
- **Potentially** 1-2cents increase in label/tag production cost
- VERSA tags are embedded with **thin metal dipoles called taggants**
 - Length of the taggant and type of material determine resonant frequency (60GHz=2.5mm), several micrometers wide, and hundreds of nanometers thick
- Can be **manufactured on a variety of materials**: paper, wood, plastic
- At 60GHz ISM Band, system uses 7GHz of freq band
- **60GHz is in the Oxygen absorption region** – allowing natural security
- **Unique RF signature** depends on many parameters and pattern
 - Taggant orientation

Wireless Sensor Technologies/John Conkle jconkle@wisen-tech.com

Close Proximity Interrogation – Rotating Turbine Blades

Components of Wireless Temperature Sensor - RLC Circuit + Diode Frequency Multiplier – Resonance varies with Temperature

1. Antenna

- Enables the interrogating signal to be received
- Sets the frequency of operation of the sensor
- Enables the return signal to be transmitted back the the Tx/Rx/Signal Processing

2. Diode

- Causes the generation of RF harmonics of the interrogating signal(as filtered by the antenna) which allow the return signal to be easily separated from the interrogating signal by the Tx/Rx/Signal Processing

3. Alumina or TBC Dielectric

- possesses temperature-dependent electrical properties(DK, dielectric constant) which alters the antenna center frequency as the temperature changes

Also Developed Wireless Heat Flux Sensor

Supported by SBIRs in Navy, DOE and Air Force

Thin Film Secure Display Inlay: A Revolutionary new Class of ID card

Tocreo Labs/Mark Krawczewicz

mark.kraz@tocreo.com - www.tocreo.com

Simple technology: On-card display – Extraordinary Security - Chain-of-Trust – batteryless

Applications: Physical & Logical Access Control, Remote log-in, & Mobile Device Unlock

Huge Market: need strategic partners for system integration in Aviation, Transit, National & Commercial network

Applications for Passive Wireless Sensors used with Near Field Communications???

Capabilites:

Dynamic Bi-State Display

- Users Access -day / hour / privileges / remaining balance can be written to the display defining role or access period by access control station
- Display can also show pending authentication, cryptographic, transactional , or other security process
- **Visual passport** – user carries auditing trail

Both an visual ID credential and a secure “Container” for data like photo, ID number, name, medical certificate, biometric, audit file, etc. .

Extraordinarily secure – same security processor as in 250 million passports

Uses only reader power – will last indefinitely

Maintains the Chain of Trust - (Users can verify at one terminal and then at a later time, facility, or secured area, prove it) – **Virtual Fence**

Single card bridges physical & network access worlds

SAW Resonant Passive Wireless Sensors for Automotive and Industrial Applications

systems per
vehicle**

Transense – GM Flexplate Project

Announcement Sep 26, 2011

<http://www.transense.co.uk/news/235-gm-transense-flexplate-project>

The Torque drive-line 'flexplate' sensor was “ originally developed for eight-cylinder engines and is now being adapted for 4 and 6 cylinder engines.

“ As part of this process Transense has successfully negotiated a variation of the otherwise exclusive licence to Honeywell, permitting Transense to deal directly with various named companies including GM preferred Tier 1 suppliers. Since then discussions about the technology have commenced between Transense and a Tier 1 supplier permitted under the Honeywell variation agreement.

The flexplate is an integral part of the vehicle powertrain control system and has the potential to improve vehicle driveability, reduce fuel consumption and improve transmission shift quality. This will be the first time a propulsion system has been able to measure engine torque 'live', enabling optimal control to be maintained throughout a vehicle's life. Current torque management systems rely on simulated models derived from production engine testing which can differ from the actual engine torque output over time. The new flexplate technology provides continuous real-time torque measurement allowing actual torque measurement on a per-vehicle basis for maximisation of engine efficiency.

GM is currently evaluating further applications of the technology for real-time vehicle control.”

High Function, Long Range Passive Wireless Sensor Tags

Powercast – Harry Ostaffe

hostaffe@powercastco.com - www.powercastco.com

Scavenge Power alternatives:

- Light / solar energy not always sufficient
and rechargeable batteries are required
- Temperature requires large ΔT 915 MHz
- Vibration has narrow bandwidth, moving parts
- **RF-based wireless power**
 - Send power over distance - μW , low mW
 - One-to-many, any-to-any topologies
 - Overcomes lack of light, temp diff., or vibration
 - Controllable: continuous, scheduled, on-demand
- **Future:** Smart Phone-based wireless power - interrogation

P1110

Continuous Power Output

- RF range: -5.0dBm to 20dBm
- Output voltage: 1.8V to 4.2V (configurable)
- Range of at least 3 meters

P2110

Pulsed Power Output

- RF range: -11.5dBm to 15dBm
- Output voltage: 1.8V to 5.25V (configurable and regulated)
- Range of at least 10 meters

Proceed With Caution: Disaster Recovery (PWST)

Potential Applications of PWST

Nezih Mrad, Ph.D.

Defence R&D Canada (DRDC), Air Vehicles Research Section (AVRS)

<http://www.drdc-rddc.gc.ca> - Nezih.Mrad@drdc-rddc.gc.ca

Mission:

To ensure the Canadian Forces are technologically prepared and operationally relevant.

- ◆ Advise on Science & Technology
- ◆ Conduct Defence research, development and analysis
- ◆ Assess technology trends, threats, and opportunities
- ◆ Engage industrial, academic and international partners in the commercialization of technology
- ◆ Conduct S&T projects for non-DND clients

PWST Interest Areas:

- Advanced Health Monitoring Capability Development and Demonstration
 - Sensors development, evaluation and demonstration (strain, load, corrosion, chemical, damage, cracking, etc.)
 - Modeling, simulation and analysis
 - Experimental capability development
- Engine PHM Capability Development and Demonstration
 - Sensors development, evaluation and demonstration (H/L Temp blade strain and temperature, blade damage and erosion, oil quality/debris monitoring and leak)
 - Data fusion and mining, etc.
- Asset monitoring and tracking
 - Materials visibility and condition assessment (e.g. ration, fuel, spare parts, etc.)

Passive Wireless SAW Temperature Sensors

Kongsberg Maritime NJ (Sensors) - Ed. Gemdjian

www.kongsberg.com - KongsbergNJ@verizon.net

SENTRY Wireless Temperature Monitoring – Technology – in use for a decade!

- Fast and reliable temperature monitoring of moving or rotating bearings
- Improved overall operational safety for crew and machinery

SENTRY Applications: "Radar Sensor" Temperature Monitoring of Large Rotating Machinery

- **Diesel Engines and Reciprocating Compressors** – new and retrofit
 - main, wrist/cross pin, crank pin, connecting rod(small end, big end, crosshead) bearings
- **Wind Turbine Gears** - the roller bearings in the planetary unit of the gearbox
- **Paper Machines' Drum** – paper roll shell temps – 6 read by 1 antenna - ID by rpm counter
- **Electric Motors & Generators** – rotor windings
- **High Voltage Power Transformers**
- **Hydraulic Clutches** – Oil temps

Sensors and Controls Enabled Solutions

George Hernandez – DOE/Energy Efficiency and Renewable Energy

Pacific Northwest National Laboratory

eere.energy.gov; George.Hernandez@ee.doe.gov

Target Applications:

- **Advanced Controls and Diagnostic Packages for Packaged Air Conditioners**
- **Self-Correcting and Self-Configuring HVAC Controls**
- **Proactive Building Energy Management – automation and occupant participation**
- **MEL(Miscellaneous Equipment Loads) Management**

Attributes Needed:

- **Temperature, Relative Humidity, CO2, Flow (air and liquid), Pressure, Power, Light**
- **Occupancy Sensors - Image Processing-Based – motions sensors don't work well**
- **Inexpensive – much less than \$100 typical per measurement location**
 - **Cost is the main deterrent for commercial buildings not installing Efficiency Monitoring/Control sensors**
- **Accurate (+/- 1 deg C is not good enough for diagnostics) - minimum drift**
- **Common interfaces**
- **Relocatable**
- **Location provided**

Baseline vs RSF Annual Plug Load EUI

Network Enabled Manufacturing(NEM) & Passive Wireless Technologies

6-3

Al Salour, Ph.D. – Technical Fellow

Boeing Research & Technology

al.salour@boeing.com 314-232-1743

NEM Considerations:

- Multi-disciplined technical skills development team
- Serve the customer needs in changing environment
- Emphasis in Composites materials and processes
- In-house fabrication core competencies “Metallic and non-Metallic”
- Supplier management “Increases in the third party material suppliers”
- Wireless secured networks
- Multi-site manufacturing & replication opportunities
- Latest advancements in real time plug & play autonomous systems

NEM Technology Needs:

- **Sensors:** Location, illumination, temperature, humidity, pressure, flow, vibration, proximity, etc.
- **RTLS:** Chokepoint, Presence, Location
 - Battery powered,
 - \$40 per sensor -> apply to high value assets
 - UWB indoor & outdoor system for Tool Kits
- **pRFID (passive RFID): Material Management**
 - Commonly used on high volume items
 - No power source (*No batteries*)
 - Inexpensive (\$0.50 or less)
 - Minimal data storage
 - EPCGlobal Standard Passive RFID Tag Inlay
 - Gen 2 Class 1 – WMRM

(Write Many-Read Many)

pRFID Applications:

Time & Temperature Sensitive Material - Sealants inventory
-Walk in freezer composite material out time / inventory
Paint - Paint mix room
Receiving - Incoming materials
Shipping - UID Bar codes on selected shipments
Work in process – Tube shop
Tool number, serial number, shelf location
Handheld reader for localization and ID – Biomark tag test

Passive Wireless Sensors Vehicle Health Management Applications

Robab Safa-Bakhsh - robab.safa-bakhsh@boeing.com

Associate Technical Fellow , Boeing Research and Technology

Customers: Boeing Commercial Aircraft, Military Fixed and Rotary Wing aircraft

Objectives: Life-Cycle Cost, Mission Reliability, Availability, Operational Plans, Supply Chain

Life Cycle Applications: Design & Development; Manufacturing, Operation & Sustainment

Sensors:

Flight Control: Electro-Mechanical Actuators, Hydraulic Actuators, Linkage, Hydraulic System

Electrical System: Generators, Converters, Contactors, APU, Batteries, Cooling System

Propulsion: Blades, Bearing, Gas path, valves

Avionic: Power Supply, Electronics

Rotor System: Rotor blades, Rotor hub, Tie bar, Rotor shaft

Fuel System: Fuel Pumps, Motors, Valves

Structures: Airframe Structure, Dynamic Components

Drive System: Gears, Bearings, Shafts, Lubrication, Housing

Electrical Wiring: Wiring insulation, Pins connections

Under Carriage: Landing Gear, Tires, Wheels, Brakes

Challenges: Reliable Comm/cross-talk, EMI, Reliable installations, Harsh environments, Sensor accuracy, life Stability

Passive Wireless Sensor Tag Research Focus:

- Meet min requirements for resolution, accuracy, repeatability & durability of traditional sensors
- System expandability & communication quality as the number of interrogated sensors increases
- EMI for long range interrogation
- Out of sight sensors implementation
- Synchronization of multiple sensors
- Synchronization of multiple interrogators
- Minimize size, weight and power of the interrogators
- Reliable installation and operation over the life of monitored component

NXP Interactive Gen2

“Bridging the Gap between Passive RFID, Sensors and Electronics”

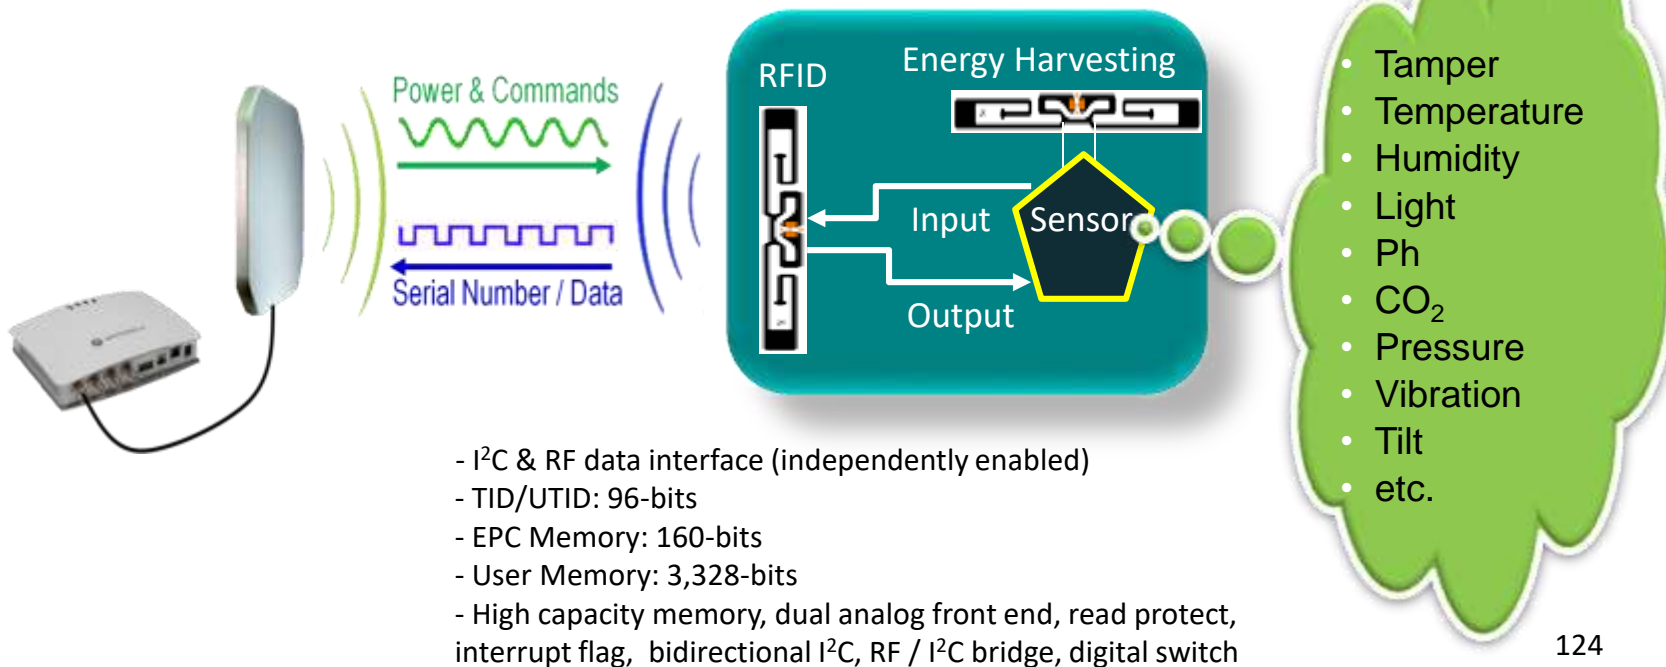

Victor Vega - Marketing Director, RFID Solutions

www.NXP-RFID.com

UCODE G2iL+ & G2iM+ series ICs add a digital input / output to RFID

- Input enables tamper or level detection for simple digital sensors
- State change is transmitted via RF to reader, along with device's unique s/n
- Output may be used as digital switch to assert a remote action
- Use cases may include alerts – for example, if bearing temperature threshold is exceeded

Aerosol Jet® (AJ) Direct Write Technology

A Manufacturing Tool for Printed Electronics

Optomec - Rich Plourde

rplourde@optomec.com

Note: Optomec does not design SAW, RFID, Antennas or Circuits

Contract Mfg: Quest Integrated Inc., Jonathan Kniss, <http://www.qi2.com>

- **Patented Material Deposition Kernel (atomizers, PCMs, print modules)**
 - Configurable for wide range of Feature Sizes & Multiplexing for volume production
- **Development Platforms Successfully Fielded**
 - for **material, process & application development / prototyping**
 - Configurable Atomizers, Heads, Motion, etc.
- **High Throughput Multiplexed Heads for Production**
 - ie: 40 nozzle head prints 2400 silicon solar wafers / hour
- **Platform Independent Modular Print Engines**
 - for **high volume manufacturing**
 - Standardized communications protocols & interfaces
 - Easily integrated with 3rd Party Manufacturing Systems
 - Manz Automation: print 80 solar collector lines on silicon wafers in 2.5 seconds
 - Speedline Technologies: print 20+ die stack interconnects / second

RFID Relevant Research Projects:

- AFE41 - Wireless Communications for Aircraft Systems
- AFE41 - Mitigating the Impact of RF Emissions from PEDs to Airplane Systems through Aircraft Hardening
- AFE50 - Energy Harvesting Potential Assessment
- AFE 56: Feasibility of Intra-Aircraft Wireless Sensors
- AFE54 - RFID Study
- AFE56s1 - Feasibility of Intra Aircraft Wireless Sensors + Supplement
- AFE73 - Wireless Avionics Intra-Communications (WAIC)

**WAIC Project Status
will be presented at
2012 PWST Workshop**

AVSI - RFID Relevant Research Projects

AFE 14: Wireless Communication for Aircraft Systems

- Develop and validate a performance model of wireless comm. within aircraft environment.
- Determine viability of using wireless comm for essential or critical aircraft systems.
- Validate model using a ground based aircraft
- Evaluate the impact of passive and active components within the aircraft (structural components, engines, and existing electronic and electro-hydraulic subsystems) at both physical and protocol layers.

AFE 41: Mitigating the Impact of RF Emissions from PEDs to Airplane Systems thru A/C Hardening

- Determine practical aircraft hardening techniques for mitigation of airplane system susceptibility to RF energy from portable electronic devices .
- Use results of this effort may be to support protective regulatory requirements .
- Select approaches for mitigating the impact of PEDs and experimentally evaluate effectiveness of the approaches.

AFE 50: Energy Harvesting Potential Assessment

- _Quantify available energy on aircraft for potential energy harvesting.
- Survey one or two types of aircraft to determine the type and amount of energy that is available for harvest.
- Look at vibration/strain, thermal & RF energy levels.
- Assess energy levels for all status of the aircraft i.e. storage, docked, taxi, climb, cruise, decent, etc., to produce an available energy profile.

•AFE 56: Feasibility of IntraAircraft Wireless Sensors

- Evaluate Current aircraft RF certification process
- Evaluate RTCA SC 202 working group and draft DO-294 T-PEDS status as extensible to wireless sensors.
- Evaluate European work in this area.
- Determine Suitability of the ISM band, Possible alternative bands,
- Determine need for encryption.
- Define next steps and or work needed to fill holes/gaps - in coordination with the FAA
- Collect & evaluate existing Channel Modeling work

AVSI - RFID Relevant Research Projects

AFE 54: RFID Study

Deliver: A quantitative model of tag & interrogator emissions

Activities:

- Select representative tags /interrogators for analysis
- Survey existing work (NASA & others)
- Develop catalog of quantitative tag & interrogator models
- Install tags & interrogators in and around selected aircraft
- Measure tag and interrogator performance on the aircraft at selected locations and correlate with previously developed models
- Develop an avionics interference model for the tag/interrogator emissions
- Measure and quantify levels of interference with aircraft avionics

AFE 56s1: Feasibility of Intra Aircraft Wireless Sensors/Supplement

Prepare an info package to start formal frequency allocation process:

- Perform economic analysis on different band classifications
- Characterize potential usage profile envelope for wireless sensors: bandwidths, data rates, power levels, modulation techniques
- Down select frequency candidates from the already identified list.
- Cost and availability of commercial radio devices that operate in the candidate frequency band shall be included as factors in down-selection.
- Establish on-going contact with FAA spectrum office, FCC WTB and OET, NTIA. Contacts with any regulatory agencies/Washington DC offices shall be coordinated in advance w/AVSI PMC member companies' reg. offices.
- Evaluate pros and cons of the RTCA route
- Involve NASA, European contacts, other industry members (possibly as additional members of this PMC)
- Define and prepare a suitable information package including detailed roadmaps for each of the different band classifications (licensed dedicated, licensed shared, unlicensed dedicated portion) use by a third party to lobby the appropriate authorities (e.g. for licensed dedicated, the FCC and NTIA)

Prepare a specific certification strategy for information assurance:

- Determine actual impact of DoD Directive 8500.1
- Study and recommend strategies to certify security approaches that use randomized techniques
- Study and recommend approaches to facilitate upgrade-able encryption/security solutions with minimal FAA re-certification effort
- Study likely characteristics of jamming and denial of service attacks
- Study likely decrypting capabilities of an information interceptor
- Define a reasonable threat model for information assurance requirements

AVSI - RFID Relevant Research Projects

AFE 73: Wireless Avionics Intra-Communications (WAIC) - <http://waic.avsi.aero/>

- Use of wireless communication technology in safety-critical systems requires that appropriate frequency bands will be available with sufficient regulatory protection against unwanted interference.
- Interact with ITU-R through its Working Party 5B to get their recommendation for an allocation proposal.
- Perform technical studies and analyses necessary to formulate and justify a proposal.
- Formalize previous industry working group / ITU-R interactions.
- Establish a WRC 2015 Agenda Item relative to protected spectrum during the World Radio Conference in 2011.
- Perform all necessary follow-up activities to support allocation of the protected spectrum through regulatory organizations.
- The project serves as an important stepping-stone on the road towards allocation of protected spectrum for wireless avionics system.

- Pending project topics
 - WAIC band sharing studies
 - WAIC/PED/RFID/WiFi coexistence
 - WAIC protocol standard
 - Active/Passive Sensor Networks
 - System architecture virtual integration
 - Integrated reliability processes
 - Certification of RFID applications

Bridging the Mid TRL Gap through Coordinated Technology Development

Milind Pimprikar, Founder & Chairman, CANEUS International

www.caneus.org; milind.pimprikar@caneus.org

CANEUS' Sole Purpose: Enable Productive Public-Private Partnerships

CANEUS Proven Capabilities:

- **CANEUS brings together** technology developers, End-users, Governmental policymakers and investors from across the world.
- **CANEUS provides** a public/ private platform of transitioning emergent technologies rapidly and efficiently from concepts to the aerospace systems / products / missions.

CANEUS' Public/Private Consortia:

1. **Fly-by-Wireless Wireless (FBW)**
2. **Small (Nano/Pico/Micro) Satellites** for Civilian and Defence Applications
3. **Reliability Testing**
4. **Devices-** Harsh Environment Sensors,
5. **Nanomaterials** for Aerospace Applications including **Micro-energetic** for power generation, energy conversion, and micro-rockets

Benefits from joining the CANEUS FBW Consortium:

1. Cost/Risk Mitigation: Access to jointly developed pre-competitive technology & proprietary product development.
2. Participation in a collaborative technology, product and business development environments.
3. Licensing access to a fair and equitable IP-brokering service.
4. Reduced time-to-market and rapid system-level product deployment through supply chain collaboration.
5. Participate in the development of global standards in cooperation with leading aerospace corporations & agencies.
6. CANEUS will “harmonize” various National Policies controlling collaborative international technology development and frequency band allocations.
7. Access to CANEUS forums/conferences as key networking platforms for Fly-by-Wireless project members to address the relevant issues.
8. Access to CANEUS' global “technology portal” that identifies state-of-the-art and the technology developers and suppliers.

Industry Canada – Opportunities for Collaboration

Jim Castellano - Aerospace, Defence and Marine Branch,
Government of Canada - Ottawa, Ontario
Jim.Castellano@ic.gc.ca - 613-954-3747

- **Industry Canada** - Mandate is to help make Canadian industry more productive and competitive in the global economy, thus improving the economic and social well-being of Canadians.

Website: http://www.ic.gc.ca/eic/site/ic1.nsf/eng/h_00000.html?OpenDocument

- **Strategic Aerospace & Defence Initiative (SADI)**: http://ito.ic.gc.ca/eic/site/ito-oti.nsf/eng/h_00023.html
 - To encourage strategic research and development (R&D) that will result in innovation and excellence in new products and services;
 - To enhance the competitiveness of Canadian A&D companies;
 - To foster collaboration between research institutes, universities, colleges & the private sector.

Note: A US company could be treated as a subcontractor under a SADI agreement with a Canadian company but it is difficult to justify.

- **Industrial and Regional Benefits (IRB's)**: <http://www.ic.gc.ca/eic/site/042.nsf/eng/00029.html>
 - Obligates Prime Contractors who have successfully won defence contracts to place economic activities in Canada
- **Defence Development Sharing Agreement (DDSA)**:
 - IC Industrial Technology Office is the contact point for DDSA projects - www.ito.ca
